

CHAPTER V. MARITAL CONDITION.

INTRODUCTION.

This chapter presents statistics relative to the marital condition of the population as returned at the Thirteenth Decennial Census, taken in 1910, with comparative figures for 1900 and 1890. Inquiry regarding marital condition was made for the first time in the Federal census in 1880, but the results of this inquiry were not tabulated at that census.

The paragraphs regarding marital condition in the "Instructions to Enumerators" in 1910 were as follows:

113. Column 8. Whether single, married, widowed, or divorced.—Write "S" for single or unmarried persons; "Wd" for widowed (man or woman); "D" for divorced; for married persons, inquire whether they have been married before, and if this is the first marriage, write "M1", but if this is the second or subsequent marriage, write "M2" (meaning married more than once).

114. Persons who were single on April 15 should be so reported, even though they may have married between that date and the day of your visit; and, similarly, persons who became widowed or divorced after April 15 should be returned as married if that was their condition on that date.

In the census statistics of marital condition the term "married," "widowed," or "divorced" refers to the marital status of the population at the time when the census was taken, so that a person, for instance, who had been widowed or divorced but had been remarried would be reported as married.

The statistics of marital condition for the United States proper are given in detail in the pages which follow. The data for Alaska, Hawaii, and Porto Rico are presented in detail in the sections on those territories in Volume III of the Thirteenth Census Reports.

Margin of error.—Very few persons are ignorant of their own marital condition; where, however, the information concerning any person was obtained from some one other than the person enumerated, incorrect replies may have been given in ignorance. The extent of such errors it is impossible to determine, but as they are unbiased errors they probably largely offset one another.

In certain cases, however, incorrect replies may have been given through intent to deceive. Some foreign-born males with wives in their home countries may have reported themselves as single. Men who disowned or who had deserted their wives or were shirking their responsibility may have reported themselves as single, while it is probable that but few males who should have been returned as single or widowed re-

ported themselves as married. On the other hand, the unmarried mother of an illegitimate child may have incorrectly reported herself as married, widowed, or divorced. It is impossible to determine the number of these misrepresentations for the total population—chiefly because it is impossible to determine the number of foreign-born males whose wives are in the home countries. If the population were unaffected by immigration or emigration the number of females in the married state at any given time must equal the number of males, but no such equality can be assumed in the total population of the United States. Moreover, it is impossible to estimate the extent of this misrepresentation among any particular class of the native whites, since native whites of native parentage often marry native whites of foreign parentage, and persons of both these classes often marry foreign-born whites.

The negro population is affected only in insignificant degree by immigration or emigration. There were, in 1910, 1,749,228 negro males 15 years of age and over reported as married, while 1,775,949 negro females of the same age were reported as married. The apparent excess of married females among the negroes thus amounted to 26,721. There were 16,496 negro males 15 years of age and over whose marital condition was not reported in 1910. Even though all of these were in reality married, and all of the 10,282 negro females of unknown marital condition were in reality single there still remains an apparent excess of married females, amounting to 10,225. The number of negro females married to white males may have exceeded the number of negro males married to white females, but the excess noted probably represents chiefly (1) deserted wives disowned by husbands, and (2) mothers of illegitimate children who erroneously reported themselves as married. However, the disparity is by no means great, and it is probable that in all classes of the population the numbers returned as single, married, and widowed, respectively, are accurate enough for all practical purposes.

The number of divorced persons reported by the census necessarily falls short of the number of living persons who have been divorced, since many divorced persons have remarried, and the census, as previously pointed out, reports simply the marital condition of the population at the date of the enumeration. At the same time it seems practically certain that the

census returns as to the number of divorced persons not remarried are below the true total, some divorced persons having been reported as single, some as married, and some as widowed.

From 1897 to 1906, inclusive, 59,336 divorces were, on an average, granted annually in this country. There is no reason to believe that this number has been decreasing since 1906, and there are, therefore, probably at least 118,672 persons divorced annually in this country. The total number of divorced persons reported in 1910 was 341,277. If the number of persons reported as divorced in 1910 is correct, and the number of divorces granted each year was the average for the years 1897 to 1906, the average length of time elapsing before the divorced persons remarry or die would be only 2.9 years. It seems incredible that this should be the case, and it is probable that the number of persons reported as divorced in 1910 was considerably less than the actual number.

It will be noted that there was a small number of persons whose marital condition was not reported by the enumerators. Except in a few tables the number and percentage of such persons are not separately shown, as they constitute only four-tenths of 1 per cent of the population 15 years of age and over. They are in all cases included in the totals on which the percentages single, married, widowed, and divorced are based, but the percentages would not be appreciably different if based exclusively upon the number of persons whose marital condition was reported.

UNITED STATES AS A WHOLE.

Total population.—Table 1 shows, by sex, the marital condition of the total population of the United States (exclusive of all outlying possessions) as reported at the census of 1910.

MARITAL CONDITION.	POPULATION OF ALL AGES: 1910			
	Male.		Female.	
	Number.	Percent distribution.	Number.	Percent distribution.
Total.....	47,332,277	100.0	44,639,989	100.0
Single.....	27,455,607	58.0	23,522,121	52.7
Married, widowed, or divorced.....	19,721,146	41.7	21,049,896	47.2
Married.....	18,093,498	38.2	17,684,687	39.6
Widowed.....	1,471,472	3.1	3,176,426	7.1
Divorced.....	156,176	0.3	185,101	0.4
Marital condition not reported.....	156,524	0.3	68,172	0.2

Of the total number of males of all ages in 1910, 58 per cent were single, 38.2 per cent married, and 3.4 per cent widowed or divorced, the corresponding percentages for females being 52.7, 39.6, and 7.5.

The number of persons under 15 years of age who are married, widowed, or divorced is naturally insignificant, comprising in 1910 only 994 males and 3,713 females. Statistics of marital condition, therefore, usually relate only to persons 15 years of age and over, who, for brevity, are sometimes called adults. Table 2 summarizes the data for persons of this age.

MARITAL CONDITION.	POPULATION 15 YEARS OF AGE AND OVER: 1910			
	Male.		Female.	
	Number.	Percent distribution.	Number.	Percent distribution.
Total.....	32,425,805	100.0	30,047,325	100.0
Single.....	12,550,129	38.7	8,933,170	29.7
Married, widowed, or divorced.....	19,720,152	60.8	21,045,983	70.0
Married.....	18,092,600	55.8	17,684,687	58.9
Widowed.....	1,471,390	4.5	3,176,228	10.6
Divorced.....	156,162	0.5	185,068	0.6
Marital condition not reported.....	156,524	0.5	68,172	0.2

¹ Includes persons of unknown age.

There were, in 1910, 32,425,805 males 15 years of age and over, and 30,047,325 females, an excess of 2,378,480 males—the number of males to 100 females being 107.9. This excess of males in the adult population of the United States has a most important bearing upon the statistics of marital condition. It accounts in part for the fact that there were 12,550,129 single men, as compared with 8,933,170 single women, or 3,616,959 more of the former than of the latter. But a further explanation of this disproportion is found in the fact that women marry at an earlier age; in other words, men remain single longer than women, and therefore there are more single men at any given time.

Other conditions being equal, the proportion of the total population who marry will be greater in a community where the sexes are numerically equal than in one where either sex outnumbers the other. In the latter case it is obvious that a larger number of persons of the sex which is in excess will remain single. Considering one sex alone, however, it is evident that the probability of marriage will increase as that sex falls below and will decrease as it rises above a numerical equality with the other sex.

Probably remarriage is more common among men than among women, hence the great excess of widows over widowers. But without doubt the excess is largely due to the fact that men usually marry at a later age than women, so that the marriage relation is more often broken by death of the husband than by death of the wife. In other words, the excess of single men over single women has as a natural correlative an excess of widows over widowers.

It will be noted that in the population 15 years of age and over there were, in 1910, 407,913 more married men than married women (18,092,600 as compared with 17,684,687), a condition largely explainable by the presence in the United States of foreign-born married men who had left wives in their native countries. The total number of men 15 years of age and over in 1910 who were or had been married (that is, the married, widowed, and divorced, taken together) was 19,720,152, or considerably less than the number of the corresponding class of women, 21,045,983. Were it not for the presence of many married men whose wives were not in this country, the disparity would, of course, be greater.

Marked differences appear between the percentages for males and those for females, as shown by Table 2. Of the males, in 1910, 60.8 per cent were either married, widowed, or divorced, while for the females the proportion was much higher, 70 per cent. Although there were, in absolute numbers, more married men than married women, the percentage married for males (55.8), being based on a larger total, was materially lower than that for females (58.9). The percentages widowed for males and for females were 4.5 and 10.6, respectively. The proportions reported as divorced were 0.5 per cent for males and 0.6 per cent for females.

Age groups.—No satisfactory analysis of statistics of marital condition can be made without considering age composition. Where a population is normally distributed by sex, the proportion which the number of persons who are or have been married forms of the total number of adults depends on three factors: (1) The age at which marriage takes place; (2) the age distribution of the population; and (3) the number who permanently remain single. Ordinarily the first and second factors have greater weight than the third in causing the differences which appear in the statistics for different classes or communities. In all cases the proportion of married, widowed, or divorced persons combined is lower among young than among older persons; consequently differences between classes or communities as to the proportion married, widowed, or divorced in the total number of adults may result merely from differences in age distribution and may not appear when comparisons are confined to limited age groups.

MARITAL CONDITION OF THE POPULATION, BY AGE PERIODS: 1910.

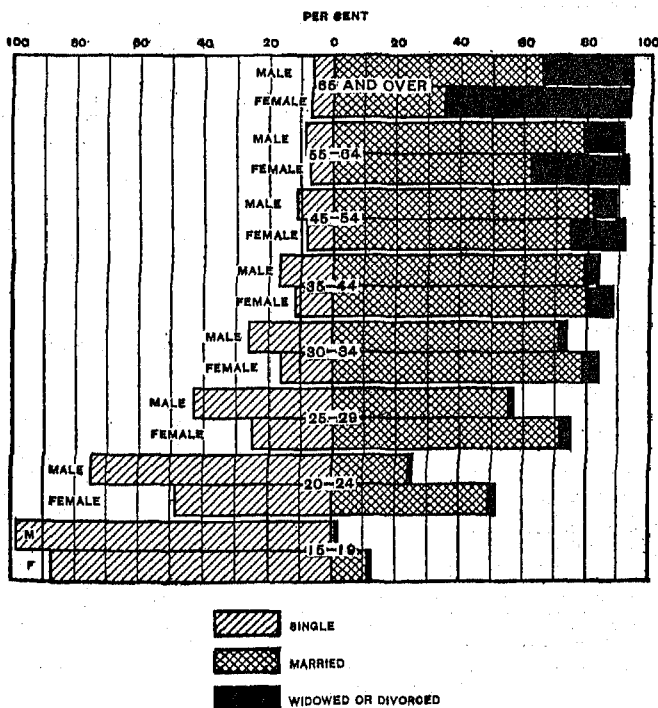

Table 3 shows, for 1910, the marital condition of the total population 15 years of age and over, classified by sex and age. The percentages are shown in the preceding diagram.

¹ Includes persons whose marital condition was not reported.
² Includes persons of unknown age.
^{*} Less than one-tenth of 1 per cent.

This table shows a marked increase in the percentage for married, widowed, or divorced persons combined, with each older age group. For males, for example, only 1.2 per cent in the age group 15 to 19 years were married, widowed, or divorced, as compared with 24.6 per cent in the age group 20 to 24 years, 64.7 per cent in the age group 25 to 34 years, and in succeeding age groups 83.1, 89.7, and 93.5 per cent, respectively.

Table 3 brings out clearly the prevailing difference between men and women as to the age of marriage. In the age group 15 to 19 years the proportion married, widowed, or divorced in 1910 was 1.2 per cent for males and 11.6 per cent for females. In the age group 20 to 24 years the percentages were 24.6 for males and 51.4 for females. In the succeeding age groups the proportions for the sexes rapidly approach equality, and for persons of 65 years and over the percentage of males married, widowed, or divorced (93.5) was slightly higher than the percentage of females (93.4).

The proportion married was higher for females than for males in the age groups covering the years 15 to 44, the disparity gradually diminishing until in the group 35 to 44 years the proportion married was almost the same for both sexes. In the group 45 to 64 years the proportion married was higher among males than among females, and in the group 65 years and over the proportion married was nearly twice as high among males as among females—65.6 per cent, as compared with 35 per cent.

At all ages the proportion widowed was higher among females than among males. From 45 to 64 years of age the proportion single among males exceeds the proportion widowed, while among females the proportion widowed is over twice as high as the proportion single. In 1910 in the group 65 years and over a little over one-fourth (27.1 per cent) of the males were widowed, while nearly three-fifths (58.1 per cent) of the females were widowed. In this age group the proportion married among males was nearly two and one-half times as great as the proportion widowed, while among females the proportion widowed was over one-half higher than the proportion married. These differences may be partly attributable to more frequent remarriage of men than of women, but are chiefly due to age differences between husbands and wives.

The differences between the absolute numbers of males and of females, respectively, in the marital condition classes distinguished, in the various age groups, as shown by Table 3, are conspicuous. In each of the age groups, except that comprising persons 65 years of age and over, the number of single men in 1910 greatly exceeded the number of single women. For age periods covering the years 15 to 34 the number of females married, widowed, or divorced exceeded the number of males, the number of males exceeding the number of females for each succeeding age period. In each age group the number of widowed females greatly exceeded the number of widowed males.

The proportion of males and of females in the several age groups of the two general marital classes is brought out more clearly in Table 4, which shows, by age groups, the number of males to 100 females in the total population 15 years of age and over, in the population returned as single, and in the aggregate married, widowed, or divorced.

AGE PERIOD.	NUMBER OF MALES TO 100 FEMALES: 1910		
	Total.	Single.	Married, widowed, or divorced.
15 years and over ¹	107.9	140.5	93.7
15 to 19 years.....	99.8	111.6	10.1
20 to 24 years.....	102.3	158.0	48.9
25 to 34 years.....	109.0	182.5	89.2
35 to 44 years.....	111.8	163.3	105.0
45 to 64 years.....	114.4	144.7	111.7
65 years and over.....	101.1	99.3	101.2

¹ Includes persons of unknown age.

Although in the population 15 years and over in 1910 there were 107.9 males to 100 females, there were 140.5 single males above this age to every 100 single females, and only 93.7 married, widowed, or divorced males to 100 such females. The proportion of males among the single increased with advancing age until in the period from 25 to 34 years there were 182.5 males to every 100 females. Above this age the proportion of males among the single gradually diminished.

From 15 to 19 years there were only about one-tenth as many males as females among the married, widowed, or divorced; from 20 to 24 years, less than half as many males. In the age group 35 to 44 years, however, and in each succeeding age group, the married, widowed, or divorced males exceeded the females.

Table 5 shows by sex the marital condition of the population above specified age limits. As the calculation is restricted to population of more advanced age, the percentage single for each sex decreases, and the percentage married, widowed, or divorced increases.

¹ Includes persons whose marital condition was not reported.

It will be noted that the excess of males in the total population 15 years of age and over is due largely to the marked excess of males among the foreign-born whites and the distribution of the foreign-born whites with respect to marital condition differs materially from that of the other classes.

Table 7 gives no direct information with regard to intermarriage among the three classes of whites. Naturally, however, these classes intermarry more or less, and consequently, as already noted, there is not necessarily, and was not in fact in 1910, an equality between the number of married males and the number of married females within any one class.

Among the native whites of native parentage the number of married males in 1910 differed but little from the number of married females, and this was also true of the negroes. Among the native whites of foreign or mixed parentage, however, the married women considerably outnumbered the married men. Probably many women of this class have married foreign-born men, since the number of the latter reported as married greatly exceeded the number of married

foreign-born women. The excess of married men in the foreign-born class is partly due, however, to the presence of men who have left their wives in the home countries.

The number of single men materially exceeded the number of single women in each of the four classes shown in the table, the excess being particularly marked among the foreign-born whites, in which group single men outnumbered single women more than two to one. In each class, except among the foreign-born whites, the number of married females exceeded the number of married males, and the number of divorced females exceeded the number of divorced males, and in each class there were more than twice as many widows as widowers.

The excess of single men over single women among the native whites of native parentage is partly attributable to the fact that there are more males of this class 15 years of age and over than there are females. According to the returns, the excess in 1910 was over 700,000, the ratio of males to females being more than 104 to 100. It has sometimes been questioned whether such a marked excess of males over females actually existed among the adult population of this class. The subject is fully discussed in the chapter on age statistics. It is possible that the number of males is slightly exaggerated through erroneous classification of native whites of foreign or mixed parentage, or even of foreign-born whites, as natives of native parentage. Such errors would more frequently occur in the case of males than in the case of females. There seems little reason to doubt, however, that there is in fact a very material excess of males among native whites of native parentage. The main explanation of the excess of single men over single women in this class of the population—as well as in the class of native whites of foreign or mixed parentage, and among the negroes—is, nevertheless, to be found in the relatively more advanced age of marriage for men. Among the native whites of foreign or mixed parentage 15 years of age and over, and among the negroes, there was, according to the returns of 1910, an appreciable excess of females.

Of the total number of native white males of native parentage 15 years of age and over in 1910, 38.1 per cent were single and 61.4 per cent married, widowed, or divorced, the corresponding percentages for females being 29.9 and 69.8.

Among native whites of foreign or mixed parentage the proportion married, widowed, or divorced was much lower for both sexes (49.5 and 58.1 per cent, respectively) than among native whites of native parentage. As shown later, this difference is only in part due to differences between the two parentage classes with regard to age distribution, although the average age of the first-named class is materially lower than that of the second.

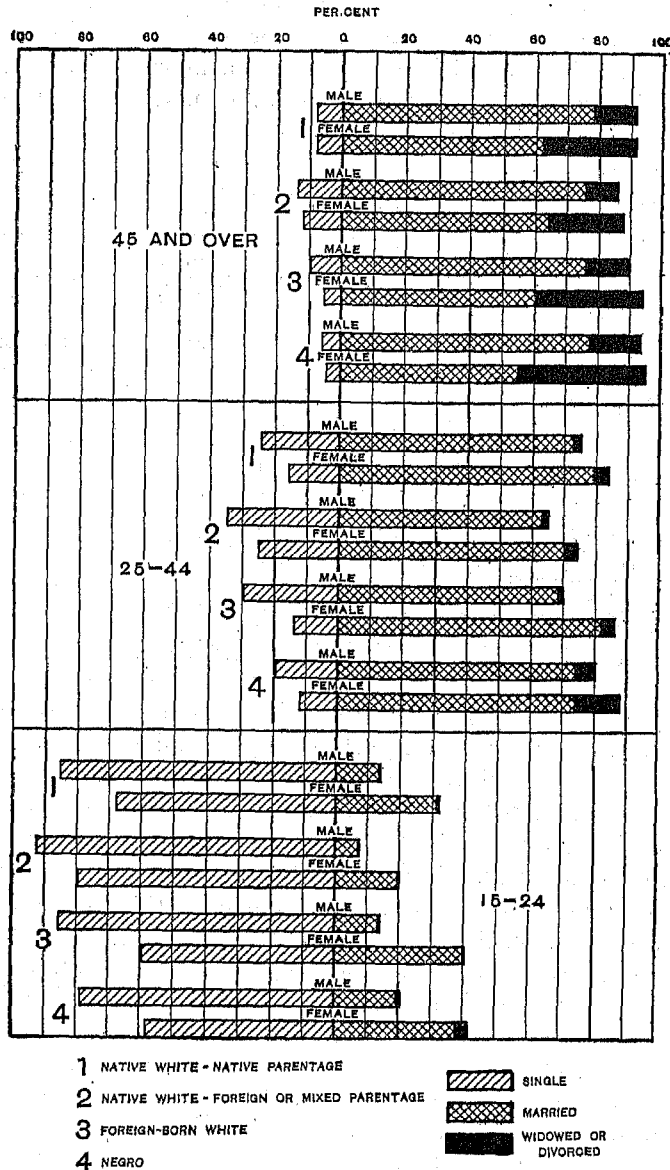

MARITAL CONDITION.

MARITAL CONDITION OF PRINCIPAL CLASSES OF THE POPULATION, BY AGE PERIODS: 1910.

In every age group and for both sexes the proportion married, widowed, or divorced was materially higher in the case of the native whites of native parentage than in the case of the native whites of foreign or mixed parentage. For example, in the age group 25 to 34 years, 68.5 per cent of the native white males of native parentage were married, widowed, or divorced, as compared with 55.9 per cent of the native white males of foreign or mixed parentage; the corresponding percentages for females were 80.4 and 69.2, respectively. It may be noted that in 1910 a much larger proportion of the native whites of foreign or mixed parentage than of the native whites of native parentage were living in urban communities, and that generally, other conditions being the same, the proportion married is smaller in the urban than it is in the rural population. Both in the urban and in the rural population separately considered, however, the proportion married among native white males and females

of native parentage exceeded the corresponding percentage for native whites of foreign or mixed parentage in every age period except among females 45 to 64 and 65 and over (see Tables 34 and 35, pp. 585 and 586).

Table 8 shows, also, that in each of the individual age groups the percentage married, widowed, or divorced was higher for native white males of native parentage than for the foreign-born white males. On the other hand, among females the percentages were somewhat lower for the native whites of native parentage than for the foreign-born whites of corresponding ages.

Comparing the marital condition of the native whites of native parentage with that of the negro population, it appears that in the age group 15 to 24 years the proportion married, widowed, or divorced among negro males is much greater than that among the white males of the parentage class specified. Above the 35th year there is very little difference in the proportions for the men of the two races. Among the females also the difference between the two races as to the proportion married, widowed, or divorced is much greater in the younger than in the older ages. It is evident, therefore, that as compared with whites of native parentage negroes generally marry at an earlier age. At every age the proportion remaining single was somewhat greater for whites.

The proportion widowed in all age groups is much higher for negroes than for whites, except that for males in the ages 65 years and over the proportion widowed is not greatly higher.

The proportion widowed or divorced among negro women was 18.4 per cent for those 35 to 44 years of age, 33.8 per cent for those aged 45 to 64 years, and 66 per cent for those 65 years and over—the corresponding percentages for native white women of native parentage being 7.3, 20, and 56.6.

Statistics according to single years of age.—The extent to which persons enter the marriage state before reaching a given age is not, in the case of younger persons, satisfactorily indicated by statistics for age periods. It is obvious, for example, that the proportion married among persons 15 to 19 years of age is largely affected by the fact that almost none as young as 15 or 16 are married. Consequently interest attaches to Table 16, page 520, showing, for the principal classes of the population, statistics of marital condition for single years of age from 15 to 34, inclusive.

As might be expected, Table 16 shows in general a decline in the proportion single with advancing age. The occasional exceptions appearing in the table are probably due to errors in the classification of persons according to age. The tendency to report ages in round numbers, which results in considerable concentration at the age of 30, probably affects single persons more commonly than married persons, because a

larger number of the returns for single persons are made, not by themselves or by members of their immediate family, but by others, such as boarding or lodging house keepers, who may lack accurate information as to age.

In 1910, of the native white males of native parentage who had reached the age of 19, 4.7 per cent had married; that is to say, 4.7 per cent of those 19 years of age were reported as either married, widowed, or divorced. Of the females of this class, 19 years of age, however, 28.9 per cent had entered the marriage state. Again, 44 per cent of the males and 65.9 per cent of the females 24 years of age had married.

On the other hand, of the native whites of foreign or mixed parentage only 1.2 per cent of the males and 14.2 per cent of the females 19 years of age were married, widowed, or divorced, and only 29.6 per cent and 51.3 per cent, respectively, of those 24 years of age.

Of the negroes, 7.8 per cent in the case of the males and 39.8 per cent in the case of the females 19 years of age had married, and 57.7 per cent and 75.3 per cent, respectively, of those 24 years of age.

Comparison with previous censuses.—Table 9 shows, by sex, the percentages single, married, widowed, or divorced in the total population 15 years of age and over for the last three censuses.

MARITAL CONDITION.	PER CENT DISTRIBUTION OF—					
	Males 15 years of age and over.			Females 15 years of age and over.

Marital condition not reported.....	0.5	0.4	0.3	0.2	0.2	0.1

There has been for both sexes a gradual advance since 1890 in the percentage of married persons and in the percentage of married, widowed, or divorced persons combined. The latter percentage rose, in the case of males, from 58.1 in 1890 to 59.4 in 1900 and 60.8 in 1910, while the corresponding percentages for females were 68.1, 68.6, and 70, respectively. These increasing percentages are only in part, if at all, attributable to changes in the color or race, nativity, and parentage composition of the population, or to changes in age distribution.

Table 10 shows, for the same three census years by sex and principal color or race, nativity, and parentage classes, the percentages reported as single, as married, widowed, or divorced, and as married, respectively.

The percentage of married, widowed, or divorced persons combined was higher in 1910 than in 1900 or in 1890 for each sex in each of the four principal color or race, nativity, and parentage groups, except that in the case of the foreign-born white males the percentage was lower in 1910 than in 1900. In the case of native

white females of native parentage the percentage married, widowed, or divorced was slightly lower in 1900 than in 1890. These higher percentages of married, widowed, or divorced persons combined were chiefly due to a higher proportion of married persons, although the proportion of widowed or divorced persons also had generally increased.

Table 10

CLASS OF POPULATION AND SEX.	PER CENT OF PERSONS 15 YEARS OF AGE OR OVER.								
	Single.			Married, widowed, or divorced.			Married.		
	1910	1900	1890	1910	1900	1890	1910	1900	1890
All classes:									
Male.....	38.7	40.2	41.7	60.8	59.4	58.1	55.8	54.5	53.9
Female.....	29.7	31.2	31.8	70.0	68.6	68.1	58.9	57.0	56.8
Native white—Native parentage:									
Male.....	38.1	39.7	40.1	61.4	59.8	59.7	56.3	55.0	55.4
Female.....	29.9	31.0	30.6	69.8	68.8	69.3	59.4	57.7	58.2
Native white—Foreign or mixed parentage:									
Male.....	50.2	54.5	61.9	49.5	45.3	38.0	46.3	42.7	36.2
Female.....	41.7	44.4	51.0	58.1	55.0	49.0	51.1	49.4	44.3
Foreign-born white:									
Male.....	31.8	29.4	32.1	67.8	70.3	67.6	62.1	63.8	62.2
Female.....	18.3	19.5	20.7	81.6	80.3	79.2	66.5	64.2	63.9
Negro:									
Male.....	35.4	39.2	39.8	64.0	60.2	60.0	57.2	54.0	55.5
Female.....	26.6	29.9	30.0	73.1	69.9	69.8	57.2	53.7	54.6

The change in the proportion married, widowed, or divorced has been particularly conspicuous among the native whites of foreign or mixed parentage. Over three-fifths (61.9 per cent) of the males of this class were single in 1890, whereas only one-half (50.2 per cent) were single in 1910. Among the females over half (51 per cent) were single in 1890 and only about two-fifths (41.7 per cent) were single in 1910. In the case of this class of the population, the increase in the proportion married is without doubt due in large measure to changes in age distribution.

Table 11 shows the percentages of males and females of specified ages reported as single, as married, widowed, or divorced, and as married, respectively, at the censuses of 1910, 1900, and 1890.

¹ Includes persons of unknown age.

In the age groups 15 to 19 years, 20 to 24 years, and 25 to 34 years, the percentage married, widowed, or divorced was greater in 1910 than in 1900, and in the case of the first two groups it was also greater in 1900 than in 1890. In the age group 25 to 34 years the percentage for males was greater in 1910 than at either of the two preceding censuses, but was less in 1900 than in 1890, while for females the percentage though greater in 1910 than in 1900, was in both those years lower than in 1890. In each of the three age groups comprising persons 35 years of age or over, a decrease occurred during both of the decades covered by the table in the percentage married, widowed, or divorced, both for males and for females, with the single exception that the percentage for males from 35 to 44 years of age increased slightly between 1900 and 1910.

Table 12 shows, for 1910, 1900, and 1890, the percentages of married, widowed, or divorced persons among males and females, respectively, for the principal color or race, nativity, and parentage groups, classified by age.

¹ Includes persons of unknown age.

For each class shown in the table the percentage of married, widowed, or divorced persons in the age groups 15 to 19 years and 20 to 24 years was higher, both for males and for females, in 1910 than in 1900

or 1890, except that the percentage for native white males of foreign or mixed parentage 15 to 19 years of age was the same in 1910 as in 1900. This would indicate that in all classes of the population a larger proportion are marrying in the earlier ages than was the case 10 or 20 years ago. At least in the case of the native whites, this change has been more conspicuous among males than among females. It appears from the table that of the native white males of native parentage from 20 to 24 years old in 1890, 20.5 per cent were married, widowed, or divorced, as compared with 23.8 per cent in 1900 and 27 per cent in 1910. For the females of this class the percentages were 51.5 for 1890, 51.2 for 1900, and 53.2 for 1910. Any falling off in the natural rate of increase of population in this country, therefore, could not be attributed to postponement of marriage.

In the age group 25 to 34 years the proportion married, widowed, or divorced was greater in 1910 than in 1900 for both males and females in all classes of the population, with the single exception of the foreign-born white males. For the two groups comprising persons 45 years of age and over, the proportion of persons in the three classes of the white population who were or had been married has shown a decrease at each census since 1890, with the single exception of the native white females of native parentage from 45 to 64 years of age, for whom the percentage was the same in 1910 as in 1900. For the white population it thus appears that, although the proportion marrying at early ages shows an increase, the proportion married, widowed, or divorced in the higher age groups was not so great in 1910 as in 1900 or 1890. Among the negroes the proportion married, widowed, or divorced in each age group was higher in 1910 than in 1900.

Comparison with foreign countries.—For purposes of comparison Table 13 is introduced, which shows the distribution, by marital condition, of the population 15 years of age and over in certain foreign countries.

It is evident from a consideration of this table that the proportion married in the United States is higher than in most foreign countries. Hungary, Bulgaria, Servia, and Russia are the only European countries included in this table in which the proportion married exceeded that in the United States. In India 68.9 per cent of the adult population were married and 18.6 per cent widowed, while only 12.6 per cent were reported as single. This is the only country included in this table in which less than 20 per cent of the total adult population were single. In Ireland over half (52.7 per cent) of the population were single and only 37.7 per cent were married. Some of the more recently settled countries, like Queensland, Victoria, and Western Australia, reported a large proportion single and a smaller proportion married.

DISTRIBUTION BY MARITAL CONDITION OF THE POPULATION 15 YEARS OF AGE AND OVER IN CERTAIN FOREIGN COUNTRIES.

⁸ Europeans only.

⁹ Legal population.

¹⁰ Widowed included with single.

Detailed tables for the United States as a whole.— Following are presented several more detailed tables regarding the marital condition of the population of the United States as a whole.

Table 14 shows for 1910 the absolute numbers single, married, widowed, and divorced for all classes combined and for each specific class of the population, by sex and age groups.

Table 15 presents percentages corresponding to the absolute numbers in the preceding table, except those for marital condition not reported.

Table 16 shows the marital condition of the total population and of each of the principal classes of the population by sex and single years of age for the ages 15 to 34, inclusive. It will be noted that in each class of the population there is a very considerable concentration of numbers at the age of 30, due to the practice of reporting ages of adults in round numbers, where the age is not exactly known.

Table 17 gives statistics of marital condition for the total population and for the principal classes by sex and age periods at each census from 1890 to 1910.

MARITAL CONDITION.

MARITAL CONDITION OF THE POPULATION OF THE UNITED STATES: 1910.

DIVISIONS AND STATES.

Causes of differences with respect to marital condition.—As shown in the tables hereafter presented, there are very considerable differences when one section of the country is compared with another as regards the marital condition, not only of the total population but also of particular classes. With respect to the total population the marital condition of males and females in any given division or state may be materially affected by the sex, age, color or race, nativity, and parentage composition of the population; while with respect to any particular class the marital condition of the total number 15 years of age and over and of males and females, respectively, may be materially affected by the sex and age composition of the class or, where intermarriage is common, of the total population within the division or state. In the last analysis, therefore, the causes of differences in marital condition, when one division or state is compared with another, are exceedingly complex.

The marital condition of the native population may be affected by interstate migration—not merely as an indirect result of the influence of migration upon sex and age distribution, but also as a direct result of differences between persons of different marital classes with respect to the disposition to migrate. There are no statistics directly bearing on this point, but one might perhaps expect that unattached persons—single persons or widowed or divorced persons without children—would be more likely to migrate than those with families. If this is the case, one would find, other things being equal, relatively fewer unmarried persons in states or divisions which lose more than they gain through interstate migration, as compared with those which gain more than they lose.

As the result of the factors just named, there may be differences between states or divisions with respect to the marital condition of the population of any given class, wholly independent of any differences with respect to the tendency toward marriage or the age at which marriages most commonly are contracted. There are, however, when one section of the country is compared with another, differences also with respect to the tendency toward marriage, and particularly with respect to the relative frequency of early marriages.

An important factor affecting the marital condition of the population of different states and divisions is the relative importance of urban population. The sex and age distribution of urban population differs from that of rural population. Moreover, as shown later, early marriages are less frequent in cities than in rural communities. Other things being equal, a state which has a large proportion of urban population is likely to have a relatively larger number of single persons in its adult population than a state which is predominantly rural.

The different kinds of causes affecting marital condition may, of course, conflict with one another. Thus, since the South has relatively a larger proportion of its adult population in the early ages of manhood and womanhood than the North, one would expect, other things being equal, to find a smaller proportion married in the South; but the tendency toward early marriage and the large proportion rural in the population of the South more than offset the effect of the age distribution.

Special causes affecting the marital condition of the foreign-born population of the several states and divisions are the period of time at which immigration has chiefly occurred, and the countries which have contributed chiefly to the foreign-born population. The period of time at which immigration has chiefly occurred also indirectly affects the marital condition of the native whites of foreign or mixed parentage, since it affects the age distribution of that class.

Marital condition of the total population, by divisions: 1910.—Table 18 shows, for the different geographic divisions of the country, the proportions single, married, widowed, or divorced among the total number of persons 15 years of age and over, classified by sex, according to the census of 1910. The absolute numbers on which these percentages are based appear in Table 30, pages 538 to 546. The percentages are summarized graphically in the following diagram.

MARITAL CONDITION OF THE TOTAL POPULATION 15 YEARS OF AGE AND OVER, BY DIVISIONS: 1910.

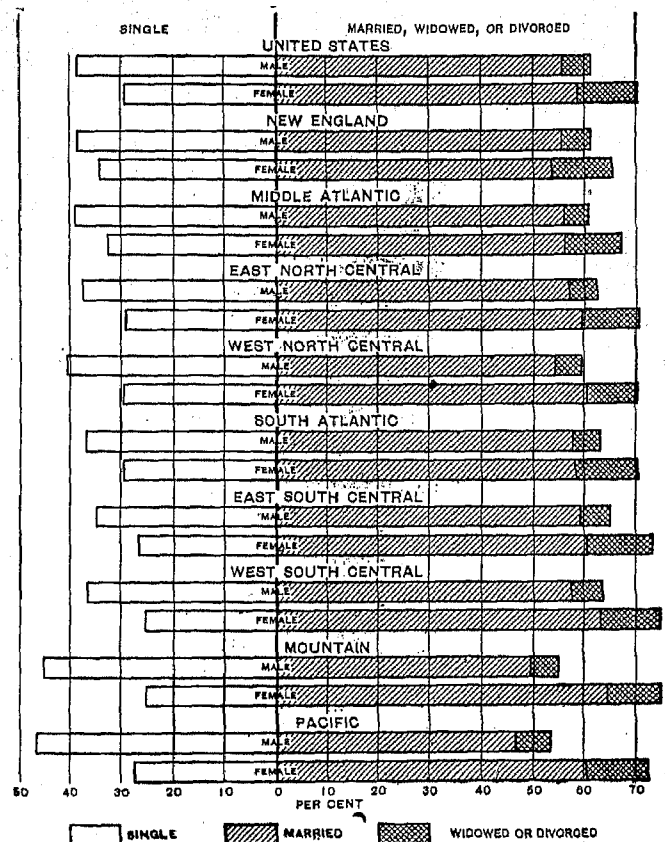

Table 18

PER CENT OF PERSONS 15 YEARS OF AGE AND OVER: 1910

Female.....	27.4	72.4	60.5	10.6	1.3

These percentages for the total population are much less significant than those subsequently presented for particular classes of the population and for age groups. The percentage of females who were or had been married was, in 1910, lower in New England than in any other geographic division. This condition is partly attributable to the fact that New England is

the only geographic division in which females outnumbered males in the population 15 years of age and over, but other factors also enter into it, as shown later. The proportion of females married, widowed, or divorced was higher in the Mountain and Pacific divisions than in any of the four northern divisions, but the proportion for males was lower in those two divisions than in any other, whether in the North or in the South. This was largely due to the fact that the excess of males over females was much greater in the Mountain and Pacific divisions than elsewhere, because of migration to them from other parts of the country. The high proportion married, widowed, or divorced in the South was partly due to the high proportion in the negro population, but partly also to the earlier age of marriage, even among the whites.

The proportion widowed was highest for both sexes in the East South Central and New England divisions. For males the proportion was lowest in the Mountain and Pacific divisions and for females in the West North Central and Mountain divisions.

The proportion divorced was highest for both sexes in the Mountain and Pacific divisions and lowest for both sexes in the Middle Atlantic division.

Color or race, nativity, and parentage classes, by divisions.—Table 19 shows, for 1910, by geographic divisions, the proportion of the male and female population 15 years of age and over in each of the principal classes of the population who were married, widowed, or divorced, and also the proportion who were married. (For absolute numbers, see Table 30.)

For the native white males of native parentage the proportion married, widowed, or divorced was higher in New England than in any other division, probably because this is the only division in which the men were less numerous in the population than the women. In none of the other northern divisions, however, was the proportion married, widowed, or divorced among males as high as it was in each of the southern divisions. The East South Central division ranked next to New England in this respect. In the Mountain and Pacific divisions, where the males greatly outnumbered the females, the proportion married, widowed, or divorced among the native white men of native parentage was very much lower than elsewhere.

For the females of this class of the population the proportion married, widowed, or divorced was somewhat higher, speaking broadly, in the West than it was in the East and higher in the South than it was in the North. There was, however, no very great difference among the four geographic divisions of the North in this respect, though the proportions in the East and West North Central divisions were somewhat higher than those in the New England and Middle Atlantic divisions. Of the southern divisions, the South Atlantic showed a slightly lower proportion married, widowed, or divorced among women of this class than the East and West North Central divisions, but the other two southern and the Mountain and Pacific divisions showed higher proportions than any of the northern divisions.

For the native whites of foreign or mixed parentage the proportions married, widowed, or divorced varied in a manner somewhat similar to that for the native whites of native parentage. It is noteworthy, however, that in the case of both sexes the proportions were much higher in the East North Central division than in any of the other northern divisions; while in New England the proportions for both sexes were much lower than in any of the other divisions. In each of the southern divisions the proportion married, widowed, or divorced in the case of both sexes was higher than in any of the northern divisions, partly because of earlier marriages, but partly because of decided differences in age distribution, the persons of this class being of higher average age in the South than in the North. In the Mountain and Pacific divisions the proportions married, widowed, or divorced among the males of this class were not very different from those in some of the northern divisions, but for females the proportions were materially higher, particularly in the Mountain division, than they were in the North, and approximately the same as those in the southern divisions.

Variations from division to division in the proportion married, widowed, or divorced among the foreign-born whites may be accounted for partly by varying age distribution and average length of residence in this country (consequent upon varying periods of largest immigration for the several divisions) and partly by

varying character of the foreign-born whites as regards nationality. In the case of the men the East South Central division, most of whose immigrants arrived at an early date, shows a higher proportion married, widowed, or divorced than any other, the East North Central division ranking next. The Mountain and Pacific divisions show very low proportions for the males. In the case of the women the West North Central division, which received the larger part of its immigration some time ago, shows the highest proportion married, widowed, or divorced, and the Mountain division the next highest proportion, while the proportion was lowest in the New England and Middle Atlantic divisions, which have been receiving very large numbers of immigrants in recent years.

For negroes, the proportions married, widowed, or divorced in the case of males were higher in the three southern divisions than elsewhere, the lower proportions in other divisions being doubtless attributable in part to the large proportion of unmarried men among negro migrants. On the other hand, the two north central and the two western divisions show a larger proportion married, widowed, or divorced among negro women than is shown by any one of the three southern divisions, this being largely the result of the fact that males outnumbered females in the negro population of these divisions. Of the southern divisions, the East South Central shows the highest proportion married, widowed, or divorced among the males and the West South Central the highest among the females, the West South Central being the only southern division in which negro males outnumbered negro females.

Comparing the different color or race, nativity, and parentage groups within the same division, it appears that for males the percentage married, widowed, or divorced was highest among the foreign-born whites in every division excepting the Pacific, where the highest proportion was among the native whites of native parentage. For females the highest percentage married, widowed, or divorced was, in all geographic divisions, among the foreign-born whites. In explanation it may be noted that a comparatively small proportion of the foreign-born white adult population is in the early age groups, in which the proportion married is low for all classes. The percentage married, widowed, or divorced was lowest in every division and for both sexes among the native whites of foreign or mixed parentage, a fact, as will be shown later, only in part attributable to the relatively large number of young persons in this class.

In all divisions, and for each color or race, nativity, and parentage group, the proportion married, widowed, or divorced was higher for females than for males, and in a majority of cases the proportion of married persons alone was higher among females.

Marital condition in relation to age.—The differences which have been shown to exist among the several geographic divisions with respect to the marital condition of

each class of the population are due partly, as already pointed out, to differences in the relative numbers of the sexes, and in the age distribution of the sex groups.

Table 20 shows for each of the principal classes of the population for the United States, by geographic divisions, the percentage married, widowed, or divorced, by sex and age groups. The absolute numbers on which these percentages are based are pre-

sented in Table 30, page 538. The percentages for the age groups from 15 to 24 years are significant as showing the prevalence of early marriages, while those for the age group 45 years and over are significant because comparatively few marriages occur after the age of 45. For comparison, the ratio of males to females in the total white population, and in the negro population, is presented.

PER CENT MARRIED, WIDOWED, OR DIVORCED IN THE POPULATION 15 YEARS OF AGE AND OVER, BY DIVISIONS: 1910.

A striking fact brought out by these figures is that the proportion of early marriages among native whites of native parentage is much larger in the South than in either the North or the West. For the three southern divisions, the proportion of women of this class 15 to 19 years of age who were married, widowed, or divorced, ranged in 1910 from 15.3 per cent to 20.1 per cent, being highest in the West South Central division. For the northern and western divisions, the proportions ranged from 6.6 per cent in New England to 14 per cent in the Mountain division. For both sexes the proportion married, widowed, or divorced of those 20 to 24 years of age was greater in each of the southern divisions than in any one of the northern divisions.

In the case of men of this age group the proportions for the southern divisions were much higher than those for the western divisions. In the case of women, however, the Mountain division shows a higher percentage married, widowed, or divorced in this age group than the South Atlantic, although not so high as the East South Central and West South Central. It is obvious that in the case of females the prevalence of early marriages, as judged by the percentage married, widowed, or divorced, in the age group from 15 to 24 years of age, is not only greater in the South than in the North, but is greater in each successive division from east to west; except that in the Pacific division the proportion among those 15 to 19 years

of age was lower than in the West North Central or Mountain divisions, while the proportion among those 20 to 24 years was lower than in the Mountain division and the same as in the West North Central. The great excess of males over females in the western divisions accounts for the comparatively small proportion married among males.

For the age 45 years and over the proportion married, widowed, or divorced among native whites of native parentage, of either sex, varied less from division to division than the corresponding proportions among younger persons. For men of this age group the proportions married, widowed, or divorced were highest in the three southern divisions and lowest in the two western divisions. In the case of females the conditions were somewhat different. The proportions married, widowed, or divorced were appreciably lower in the New England, Middle Atlantic, and South Atlantic divisions, along the eastern seaboard, than in any of the divisions farther west. The highest percentages in 1910 were found in the West South Central, Mountain, West North Central, and Pacific divisions, in the order named, the differences among these four divisions being slight. In the West South Central division the high figure for females is explained both by the high percentage married characteristic of the South generally and by the fact that males decidedly outnumber females, largely as the result of migration from other states.

In the case of the native whites of foreign or mixed parentage it will be seen that for the younger age groups, from 15 to 24 years, the differences between the South and the rest of the country were in general much less marked than in the case of the native whites of native parentage, although the proportion married, widowed, or divorced among young persons was much higher in the West South Central division than in the North. Throughout the country early marriages are much less frequent among native whites of foreign or mixed parentage of both sexes than among native whites of native parentage, and, moreover, in all age groups shown in Table 20 the proportion married, widowed, or divorced is everywhere appreciably lower for the former than for the latter class.

Table 20 shows that early marriages among negroes of both sexes are much more common in the South than in the North, and more common among the negroes than among the whites. The statistics for negroes in the divisions of the North and West are materially affected by migration.

Marital condition, by states.—Table 21 shows, by states, the percentage married, widowed, or divorced for all persons 15 years of age and over in the total population and in the principal classes of the population, by sex, for 1910. The absolute numbers, together with separate percentages for those single, those married, and those widowed, appear in Table 32, page 548.

In general the states show conditions with respect to the marital condition of each class of the population roughly similar to those prevailing in the geographic divisions in which they are respectively situated. There are, however, some rather conspicuous exceptions.

It will be seen that in the case of native whites of native parentage the states of Maine, New Hampshire, and Vermont show, for both sexes, a decidedly larger proportion married, widowed, or divorced than the three southern New England states. These differences may be in part accounted for by differences in age distribution, and in the proportions urban and rural; and by the fact that from the three northern New England states there has been a considerable net emigration of native whites of native parentage, which has undoubtedly somewhat reduced the proportion single. Wisconsin shows a very much smaller proportion

married, widowed, or divorced for both sexes in this class of the population than any of the other states in the East North Central division. This difference is not due to peculiar age distribution of the population of Wisconsin, but appears generally throughout each age group (see Table 32, p. 548). The conditions in Minnesota are very similar to those in Wisconsin, the proportion married, widowed, or divorced being much lower, in the case of both sexes, in that state than in most of the other states of the West North Central division. It may be noted that in the case of the males alone the proportion married, widowed, or divorced was also relatively low in North and in South Dakota—a fact attributable largely to the decided excess of males in the population of those states.

In Louisiana the proportion married, widowed, or divorced among native whites of native parentage, of both sexes, was materially lower than in the other states of the West South Central division, this being true in general of all the age groups. Finally, very considerable differences appear among the several states of the Mountain division with respect to the marital condition of native white men of native parentage, these differences being largely attributable to the decided variations in the ratio of males to females, the excess of males in some of the states being exceedingly great. So far as women of this class are concerned, most of the states of the Mountain division show approximately uniform conditions, but it is noteworthy that the proportion married, widowed, or divorced was decidedly lower in Utah than in any other Mountain state, partly because there is less excess of males in Utah than elsewhere in the division. Early marriages are, however, much less common among the women in Utah than in other Mountain states, although there was comparatively little difference as to marital condition in the case of the women of the older age groups.

For the native whites of foreign or mixed parentage, there are also some exceptional conditions in particular states. Differences appear between the northern and the southern New England states similar to those in the case of the native whites of native parentage. Indiana shows a decidedly larger proportion married, widowed, or divorced among both males and females than the other states of the East North Central division. Wisconsin does not show such exceptional conditions with respect to this class as with respect to the native whites of native parentage, but Minnesota and North Dakota show for this class, as for the native whites of native parentage, much smaller proportions of both sexes, married, widowed, or divorced as compared with other states of the West North Central division. West Virginia has relatively high proportions married, widowed, or divorced among persons of this class as compared with other South Atlantic states, and Delaware, the lowest proportions. Texas shows for both sexes a much smaller proportion than the other states of the West South Central division,

largely because of differences in age distribution. The proportions married, widowed, or divorced among males of this class in the various states of the Mountain division are affected by variations in the sex ratio in the same way as those for the native whites of native parentage.

Considerable variations appear among the states even within a single division with respect to the marital condition of the foreign-born white population, these being largely attributable to differences with respect to the period of time at which immigration has chiefly occurred and with respect to the countries from which immigrants have been drawn.

West Virginia presents conditions with respect to the marital condition of negro men somewhat different from those of most other Southern states, the proportion married, widowed, or divorced being much lower, doubtless largely because of the migration of unmarried men to West Virginia from states farther south, especially for work in the mines. The proportion married, widowed, or divorced among negro women in Florida and Oklahoma was higher than in the other Southern states.

Table 22 shows, by states, for 1910, the percentages single, married, widowed, divorced, and not reported, respectively, without distinction by sex, of the total population 15 years of age and over.

There are four states—Wyoming, Montana, Nevada, and Minnesota—in which over 40 per cent of the population were single. All of these states, with one exception, are in the Mountain division. There are two states—Arkansas and Oklahoma—in which less than 30 per cent were single. Both of these states are in the West South Central division.

There are nine states in which 60 per cent or more of the population were married. Of these Georgia, Alabama, Mississippi, Arkansas, Oklahoma, Kansas, and New Mexico are contiguous states stretching nearly across the continent, while Michigan and Indiana are in the East North Central division. There are only two states in which less than half of the population were married, Wyoming with 49.4 per cent and Nevada with 49.7 per cent. Montana and the District of Columbia follow with 50.6 per cent and 51.1 per cent, respectively.

In the District of Columbia 10.8 per cent of the population 15 years of age and over were widowed. Next in order follow Maine and New Hampshire in each of which 9.3 per cent of the adult population were widowed. In North Dakota and Wyoming only 3.9 per cent were widowed.

According to Table 32 there are three states in which more than half of the males 15 years of age and over were single. These are Wyoming (56.3 per cent), Montana (52.4 per cent), and Nevada (51.3 per cent). All of these are in the Mountain division. There are seven states in which less than 35 per cent of the adult males were single. They are Indiana, Georgia,

Arkansas, Mississippi, Vermont, Alabama, and Maine. Four of these are Southern states, two in New England, and one in the East North Central division.

PACIFIC:					
Washington	30.8	53.0	5.3	1.0	0.9
Oregon	30.2	53.2	6.0	1.1	0.4
California	38.2	52.1	7.8	1.2	0.8

There are two states—Georgia and Alabama—in which three-fifths or over of the adult males were married. In Wyoming less than two-fifths of the adult males were married. In all of the New England, Middle Atlantic, East North Central, South Atlantic, East South Central, and West South Central states, more than half of the adult males were reported married, while in all of the Pacific states, all but three of the Mountain states, together with Minnesota and North Dakota in the West North Central division, less than half of the adult males were married.

The proportion of males reported as widowed was highest in Maine (6.4 per cent), Vermont (6.2 per cent), and New Hampshire (6.1 per cent). These New England states are the only ones in which more than 6 per cent of the adult males were widowed. Less than 3 per cent of the adult males were widowed in Wyoming (2.8 per cent), North Dakota and Utah (2.9 per cent).

More than one-third of the females 15 years of age and over were single in Massachusetts (36.9 per cent), Rhode Island (35.8 per cent), Minnesota (35 per cent), District of Columbia (34.5 per cent), New York (33.7 per cent), and Connecticut (33.6 per cent). With the exception of Minnesota and the District of Columbia these are all northeastern states. Less than one-fourth of the adult female population were single in Texas, Nevada, Oklahoma, Arizona, New Mexico, Florida, Wyoming, Arkansas, and Idaho. With the exception of Florida all of these states are in the West South Central and Mountain divisions. Over two-thirds of the adult female population were reported married in Oklahoma, Wyoming, Idaho, and Nevada. With the exception of Oklahoma all of these states are in the Mountain division. In the District of Columbia only 48.8 per cent of the adult female population were married. There is no state in which less than half of the adult females were married. In Massachusetts 51.2 per cent of the adult females were married, followed by Rhode Island (52.2 per cent). At least one-eighth of the adult females were widowed in Georgia, Mississippi, New Hampshire, Louisiana, and the District of Columbia. The smallest proportion of widowed among adult females was reported in North Dakota with 5.2 per cent.

Comparative statistics of marital condition, by divisions: 1890–1910.—Table 23 shows, by geographic divisions, the percentage married, widowed, or divorced in the total population and in each of the principal classes of the population, classified according to age, for each of the last three censuses. The absolute numbers upon which the percentages for 1900 and 1890 are based are not published in this Report but will be found in the reports of the respective censuses.

In every division the proportion married, widowed, or divorced in the total adult population, for both sexes, was higher in 1910 than in 1890, and except for females in the Mountain division, higher than in 1900. In the three northeastern divisions—the New England, Middle Atlantic, and East North Central—and also in two of the southern divisions and in the Pacific division, the proportion for both sexes increased gradually from 1890 to 1910. In the other divisions, while the proportion for males increased from each census to the next, in the case of females the proportion married, widowed, or divorced in the West North Central and West South Central divisions was higher in 1890 than in 1900.

Particular interest attaches to the figures showing the changes with respect to early marriages, namely, the percentages for the age groups under 25 years. There has been throughout the entire country an increase in the proportion of males marrying at early ages, but for females the tendency has not been entirely uniform. In most of the divisions there has been, for both sexes, a decrease in the proportion married, widowed, or divorced in the age periods above 45 years.

MARITAL CONDITION.

PER CENT MARRIED, WIDOWED, OR DIVORCED IN THE POPULATION 15 YEARS OF AGE AND OVER, BY DIVISIONS: 1910, 1900, AND 1890.

[Per cent not shown where base is less than 100.]

¹ Totals include persons of unknown age.

More significant than the changes with respect to the total population have been those with respect to individual classes. Among the native white males of native parentage 15 years of age and over the proportion married, widowed, or divorced was higher in 1910 than in 1890 in every geographic division except the Middle Atlantic; but in the case of women there were five geographic divisions—the New England, Middle Atlantic, East North Central, West North Central, and Mountain—in which the proportion was lower in 1910 than 20 years before. The tendency toward earlier marriages among men of this class has been general throughout the country. On the other hand, in three divisions—the New England, Mountain, and Pacific—the proportion of women 15 to 19 years of age who were married, widowed, or divorced was lower in 1910 than in 1890; and in these divisions, and also in three others—the Middle Atlantic, West

North Central, and West South Central—the proportion for the age group 20 to 24 years was lower in 1910 than in 1890. In six of the geographic divisions, however, the proportion of women of this class 20 to 24 years of age who were married, widowed, or divorced was higher in 1910 than in 1900, the only exceptions being the New England, Middle Atlantic, and Mountain divisions.

In almost every division the proportion married, widowed, or divorced for native whites of native parentage of both sexes, in the age groups 45 years and over, was lower in 1910 than it was in 1890.

It is possible that the explanation of the fact that the tendency toward earlier marriages is more marked in most parts of the country in the case of men than of women is to be found in the rapid growth of urban population. As shown later, women less often marry at an early age in cities than in rural communities.

¹ Totals include persons of unknown age.

In the case of the native whites of foreign or mixed parentage there has been, since 1890, in every division an increase for both sexes in the proportion married, widowed, or divorced. This is true not only for the total number 15 years of age and over—which might be expected from the fact that the average age of persons of this group was considerably higher in 1910 than 10 or 20 years before—but in most cases it is true specifically for persons in the age periods 15 to 19 and 20 to 24 years. In other words, early marriages appear to be more common in this class of the population throughout the country than formerly. In some divisions the proportions in the age groups 15 to 24 years who were married, widowed, or divorced were almost twice as high in 1910 as in 1890. Thus, in the Pacific division, of the males of this class from 20 to 24 years old only 7 per cent in 1890 were married, widowed, or divorced, as compared with 13.5 per cent in 1910. The only striking exception to this tendency appears in the Mountain division in the case of females, the proportion married, widowed, or

divorced in the age period 20 to 24 years being lower in 1910 than in 1890. There has been among persons of this class in most of the divisions a rather widespread decline in the proportion married, widowed, or divorced in the more advanced age groups.

In every division except New England the proportion of foreign-born white males 15 years of age and over who were married, widowed, or divorced was lower in 1910 than in 1900, this decrease resulting mainly from the fact that recent immigration has consisted largely of unmarried males. In the majority of the divisions, however, the proportion was higher than in 1890. The most marked change between 1900 and 1910 was in the South Atlantic division, where the proportion was only 66.4 per cent in 1910, as compared with 73.2 per cent in 1900 and 71.5 per cent in 1890. For foreign-born females, however, the proportion was higher in 1910 than in either 1900 or 1890 in every division except the West South Central, in which the proportion for 1910 was the same as that for 1900, although higher than that for 1890.

MARITAL CONDITION.

¹ Totals include persons of unknown age.

Among negroes of both sexes the tendency toward earlier marriage is almost universal throughout the country. This is largely the explanation of the fact that in every geographic division the proportion married, widowed, or divorced was higher in 1910 than in 1900 or 1890 in the total adult negro population of each sex. The increase in the proportion mar-

ried, widowed, or divorced among the earlier age groups has been very conspicuous in some of the geographic divisions outside the South, where negroes are relatively few, and has been very considerable in the South itself, noticeably so in the South Atlantic division. The proportions in the upper age groups have changed but little.

Detailed tables, by divisions and states.—The detailed tables dealing with the marital condition of the population, by geographic divisions and states, are so extensive that they are presented after the text discussion of the statistics regarding the urban and rural population and the population of principal cities. These tables, which appear on pages 538 to 584, are as follows:

Table 30 (pp. 538 to 546) shows by geographic divisions, for 1910, statistics of marital condition in detail for the principal classes of the population, the classification by age being more detailed than that carried by the tables for the states. Figures are shown also for the Indians, Chinese, and Japanese separately, but without age classification.

Table 31 (p. 547) shows by divisions and states, for 1910, the number of persons of all ages (including children under 15) single, married, widowed, or divorced, respectively.

Table 32 (pp. 548 to 572) presents, for 1910, detailed statistics regarding marital condition by states, similar to those presented by divisions in Table 30, the age classification, however, being less detailed.

Table 33 (pp. 573 to 584) presents, by divisions and states, for 1910, 1900, and 1890, statistics regarding the marital condition of the total population 15 years of age and over and of the principal classes of the population of that age.

URBAN AND RURAL COMMUNITIES.

United States as a whole.—The tables which follow show the differences between urban and rural communities with respect to the marital condition of the population.

Table 24 shows the percentage married, widowed, or divorced in the urban and rural communities of the United States as a whole in 1910, with distinctions of sex, color or race, nativity, parentage, and age. (For the absolute numbers, see Table 34.)

It will be seen that in the case of every class of the population covered by the table, marriage, on the part of women, is less common or is longer deferred in cities than in rural communities. In every age group of each class the proportion married, widowed, or divorced among women was lower in urban than in rural communities, the difference being particularly great in the case of the younger age groups. For men a similar difference appears in the case of all the native groups—the native whites of native parentage, the native whites of foreign or mixed parentage, and the negroes—with only one minor exception, the percentage married, widowed, or divorced for native white men of foreign or mixed parentage 15 to 24 years of age being higher in urban than in rural communities. In the case of the foreign-born white males, however, the proportion married, widowed, or divorced in each age group was greater in the urban than in the rural communities. The difference between urban and rural communities with respect to the native groups in the United States

as a whole is much less conspicuous in the case of males than in the case of females, and, as shown later, in some of the geographic divisions the conditions as to males are the opposite of those for the United States as a whole. In considering the apparent abnormally low proportion married, widowed, or divorced among the foreign-born white men in rural communities it should be borne in mind that a very large number of such men were engaged not in agriculture, but in mining or lumbering, or in construction work on railroads or other enterprises. Of the foreign-born whites engaged in these occupations, a very large proportion are single.

¹ Includes persons of unknown age.

The fact that in every age group the proportion of single women was greater in urban than in rural communities is largely attributable to the greater opportunities for women to support themselves in the cities. As a result of these greater opportunities, the excess of males over females which appears in the white population of the country was, as already shown in Chapter III, much less marked in urban than in rural communities, and, in fact, in the urban communities of some sections of the country the females outnumbered the males, while in no geographic division of the country was this true of rural communities. Migration from country to city is more common among young unmarried men and women than among married persons or older persons, and the number of unmarried women who move to the cities is probably greater than the number of unmarried men.

This table shows further that the differences among the several classes of the population with respect to marital condition are by no means wholly attributable to differences among those classes with respect to the proportion resident in urban and rural communities, respectively. Differences similar to those which appear in the total population appear both in the

urban and in the rural communities. Thus in both classes of communities the proportion married, widowed, or divorced among native whites of foreign or mixed parentage in all age groups is materially lower than the corresponding proportion for the native whites of native parentage; while in both classes of communities the foreign-born white women show a much larger proportion married, widowed, or divorced than either of the native white classes. In both classes of communities, moreover, the negroes of both sexes show, with one slight exception, a larger proportion married, widowed, or divorced in all age groups than the native white classes.

Geographic divisions.—Table 25 shows, for each geographic division in 1910, the percentage married, widowed, or divorced among native whites of native parentage in urban and rural communities, respectively. The absolute numbers in each marital condition class, together with separate percentages for those single, married, or widowed, respectively, are shown in Table 35, page 586, which also presents the data regarding other classes of the population on which Tables 26, 27, and 28 are based.

¹ Includes persons of unknown age.

The above table shows that in this, the most important class of the population numerically, there was in no geographic division any exception to the rule that among women marriage is less common or is longer deferred in urban than in rural communities. Particularly in the case of the younger age groups the proportion of women married, widowed, or divorced was very much lower in urban than in rural communities. In the

case of men, the northern and western divisions present exceptions to this condition, these exceptions, however, being found only in the age group 15 to 24 years and in the age group 45 years and over, none appearing in the group 25 to 44 years.

Table 26 presents percentages for the native whites of foreign or mixed parentage similar to those given in Table 25. The conditions with respect to this class are very similar to those with respect to the native whites of native parentage. For women there was but one exception to the rule that the proportion married, widowed, or divorced is lower in urban than in rural communities, and the exceptions in the case of the men are for the most part in the same divisions that show exceptions with respect to the native white men of native parentage.

¹ Includes persons of unknown age.

Table 27 presents percentages regarding the marital condition of the foreign-born whites by geographic divisions. The conditions with respect to the marital condition of foreign-born white women in the two classes of communities were similar to those for the native white classes. In the case of the men, however, it will be seen that in every geographic division, except the West South Central, the proportion married, widowed, or divorced in one or more of the age groups was higher in urban than in rural communities; and in six of the divisions this was true of every age group, although in the East North Central division, where it holds true of every separate age group, it does not hold true of the total number 15 years of age and over,

because of their unusual age distribution. A possible reason for this condition with respect to the foreign-born white men in rural communities has already been suggested (see p. 534). Table 27 shows altogether extraordinary differences between males and females among the foreign-born whites with respect to the proportion married, widowed, or divorced in the earlier ages, particularly in the rural communities. For example, in the rural communities of the Pacific division only 7.6 per cent of the foreign-born white men 15 to 24 years of age were reported as married, widowed, or divorced, while the corresponding percentage for women was 54.3. In the Mountain division the corresponding percentages were 9.8 and 59.3; in the South Atlantic, 11.3 and 60.3.

¹Includes persons of unknown age.

Table 28 relates to the marital condition of the negroes in urban and rural communities. It will be seen that in the three southern divisions, where the great bulk of the negro population is found, the proportion married, widowed, or divorced among negro women was uniformly lower in urban than in rural communities; and the same was true of negro men, except that in the West South Central division the proportion for those from 15 to 24 years of age was slightly higher in the urban communities. Outside of the South, where the negro population has been greatly affected by migration, the conditions are quite different. In several of the northern and western divisions the proportion, even of the women in some age groups, who were married, widowed, or divorced was higher in urban than in rural communities; and this was the case quite uniformly with respect to the men, though a few exceptions appear in certain age groups.

¹Includes persons of unknown age.

Classes of cities.—Table 29 shows, for the United States as a whole, the percentage married, widowed, or divorced among persons 15 years of age and over, in rural communities and in cities classified into three groups according to size. The absolute numbers on which this table is based, together with more detailed percentages, and also corresponding figures for each geographic division, are presented in Table 36, page 596.

Table 29

CLASS OF POPULATION.	PER CENT OF PERSONS 15 YEARS OF AGE AND OVER MARRIED, WIDOWED, OR DIVORCED: 1910							
	Rural communities.		Cities of 25,000 to 100,000.		Cities of 100,000 and over.		Cities of 100,000 and over.	
	Male.	Female.	Male.	Female.	Male.	Female.	Male.	Female.
All classes.....	62.1	73.2	61.5	69.0	60.0	67.4	87.9	65.5
Native white—Native par....	62.8	72.6	62.2	68.3	59.9	66.7	84.6	62.0
Native white—For. or mixed percentage.....	51.5	64.0	51.6	58.0	49.1	55.4	46.5	53.9
Foreign-born white.....	67.4	89.8	67.8	82.8	67.9	78.9	68.0	77.6
Negro.....	64.8	73.7	62.9	71.8	62.8	73.0	61.5	71.6

Not only was there, in the case of the native white classes and the negroes, a smaller proportion of married, widowed, or divorced persons in urban than in rural communities, but the proportion almost uniformly decreased with increasing size of cities. In the case of females of each of the two native white classes, there was a steady decline in the proportion married, widowed, or divorced with increasing size of cities; and the same was true of the negroes, except that the cities of 25,000 to 100,000 inhabitants showed a higher percentage than either of the other urban groups—a condition found not only in the country as a whole but in

most of the geographic divisions. In the case of males the native whites of native parentage show a uniform decline in the proportion with increasing size of cities, but, although this is true of the United States as a whole, there are exceptions to the rule in some of the geographic divisions corresponding more or less closely to the exceptions already pointed out with respect to urban and rural communities. In the case of native white males of foreign or mixed parentage, however, the cities of 2,500 to 25,000 inhabitants show a higher proportion married, widowed, or divorced than the rural communities in the United States as a whole, and in a number of the geographic divisions there were exceptions to the rule that the proportion declines with increasing size of cities. Among the foreign-born white males the proportion married, widowed, or divorced increased with increasing size of cities, this being true of the United States as a whole and for two of the geographic divisions; but for females the opposite was almost uniformly the case.

Detailed tables for urban and rural communities.—The detailed tables dealing with the marital condition of the population 15 years of age and over in urban and rural communities and in cities classified according to size appear on pages 585 to 614. These tables relate to 1910 only.

Table 34 (p. 585) presents statistics regarding the marital condition of the population of urban and rural communities in the United States as a whole. It differs from Table 35 in the fact that the age classification is more detailed.

Table 35 (pp. 586 to 595) shows, for the United States and each geographic division, statistics regarding the total population and each important class of the population, according to three age groups, for urban and rural communities.

Table 36 (pp. 596 to 600) shows, for the United States and for geographic divisions, statistics regarding the marital condition of the total population and of each of the principal classes of the population, for urban and rural communities and for cities classified according to size.

Table 37 (pp. 601 to 614) gives statistics for the urban and rural population of each state, the total population in each case being classified into three age groups, while for the individual classes of the population the figures relate to the aggregate population 15 years of age and over.

PRINCIPAL CITIES.

Tables dealing with the marital condition of the population of individual cities are presented on pages 615 to 687.

Table 38 (pp. 615 to 642) presents detailed statistics regarding marital condition for each city of 100,000 inhabitants or more, the data being given for the total population and for each of the principal classes of the population according to age groups, and for the minor classes of the population without distinction of age.

Table 39 (pp. 643 to 646) gives statistics regarding marital condition for each of the principal classes of the population 15 years of age and over in 1910, 1900, and 1890 in cities of 250,000 inhabitants or more.

Table 40 (pp. 647 to 652) gives statistics regarding marital condition for each of the principal classes of the population 15 years of age and over in 1910 and 1900, by sex, in cities of 100,000 to 250,000 inhabitants.

Table 41 (pp. 653 to 687) gives statistics regarding marital condition of the population 15 years of age and over in 1910, by sex, classified according to three age groups and according to the principal classes, in cities of 25,000 inhabitants or more.

CHAPTER V. MARITAL CONDITION.

INTRODUCTION.

This chapter presents statistics relative to the marital condition of the population as returned at the Thirteenth Decennial Census, taken in 1910, with comparative figures for 1900 and 1890. Inquiry regarding marital condition was made for the first time in the Federal census in 1880, but the results of this inquiry were not tabulated at that census.

The paragraphs regarding marital condition in the "Instructions to Enumerators" in 1910 were as follows:

113. Column 8. Whether single, married, widowed, or divorced.—Write "S" for single or unmarried persons; "Wd" for widowed (man or woman); "D" for divorced; for married persons, inquire whether they have been married before, and if this is the first marriage, write "M1", but if this is the second or subsequent marriage, write "M2" (meaning married more than once).

114. Persons who were single on April 15 should be so reported, even though they may have married between that date and the day of your visit; and, similarly, persons who became widowed or divorced after April 15 should be returned as married if that was their condition on that date.

In the census statistics of marital condition the term "married," "widowed," or "divorced" refers to the marital status of the population at the time when the census was taken, so that a person, for instance, who had been widowed or divorced but had been remarried would be reported as married.

The statistics of marital condition for the United States proper are given in detail in the pages which follow. The data for Alaska, Hawaii, and Porto Rico are presented in detail in the sections on those territories in Volume III of the Thirteenth Census Reports.

Margin of error.—Very few persons are ignorant of their own marital condition; where, however, the information concerning any person was obtained from some one other than the person enumerated, incorrect replies may have been given in ignorance. The extent of such errors it is impossible to determine, but as they are unbiased errors they probably largely offset one another.

In certain cases, however, incorrect replies may have been given through intent to deceive. Some foreign-born males with wives in their home countries may have reported themselves as single. Men who disowned or who had deserted their wives or were shirking their responsibility may have reported themselves as single, while it is probable that but few males who should have been returned as single or widowed re-

ported themselves as married. On the other hand, the unmarried mother of an illegitimate child may have incorrectly reported herself as married, widowed, or divorced. It is impossible to determine the number of these misrepresentations for the total population—chiefly because it is impossible to determine the number of foreign-born males whose wives are in the home countries. If the population were unaffected by immigration or emigration the number of females in the married state at any given time must equal the number of males, but no such equality can be assumed in the total population of the United States. Moreover, it is impossible to estimate the extent of this misrepresentation among any particular class of the native whites, since native whites of native parentage often marry native whites of foreign parentage, and persons of both these classes often marry foreign-born whites.

The negro population is affected only in insignificant degree by immigration or emigration. There were, in 1910, 1,749,228 negro males 15 years of age and over reported as married, while 1,775,949 negro females of the same age were reported as married. The apparent excess of married females among the negroes thus amounted to 26,721. There were 16,496 negro males 15 years of age and over whose marital condition was not reported in 1910. Even though all of these were in reality married, and all of the 10,282 negro females of unknown marital condition were in reality single there still remains an apparent excess of married females, amounting to 10,225. The number of negro females married to white males may have exceeded the number of negro males married to white females, but the excess noted probably represents chiefly (1) deserted wives disowned by husbands, and (2) mothers of illegitimate children who erroneously reported themselves as married. However, the disparity is by no means great, and it is probable that in all classes of the population the numbers returned as single, married, and widowed, respectively, are accurate enough for all practical purposes.

The number of divorced persons reported by the census necessarily falls short of the number of living persons who have been divorced, since many divorced persons have remarried, and the census, as previously pointed out, reports simply the marital condition of the population at the date of the enumeration. At the same time it seems practically certain that the

census returns as to the number of divorced persons not remarried are below the true total, some divorced persons having been reported as single, some as married, and some as widowed.

From 1897 to 1906, inclusive, 59,336 divorces were, on an average, granted annually in this country. There is no reason to believe that this number has been decreasing since 1906, and there are, therefore, probably at least 118,672 persons divorced annually in this country. The total number of divorced persons reported in 1910 was 341,277. If the number of persons reported as divorced in 1910 is correct, and the number of divorces granted each year was the average for the years 1897 to 1906, the average length of time elapsing before the divorced persons remarry or die would be only 2.9 years. It seems incredible that this should be the case, and it is probable that the number of persons reported as divorced in 1910 was considerably less than the actual number.

It will be noted that there was a small number of persons whose marital condition was not reported by the enumerators. Except in a few tables the number and percentage of such persons are not separately shown, as they constitute only four-tenths of 1 per cent of the population 15 years of age and over. They are in all cases included in the totals on which the percentages single, married, widowed, and divorced are based, but the percentages would not be appreciably different if based exclusively upon the number of persons whose marital condition was reported.

UNITED STATES AS A WHOLE.

Total population.—Table 1 shows, by sex, the marital condition of the total population of the United States (exclusive of all outlying possessions) as reported at the census of 1910.

Divorced.....	156,176	0.3	185,101	0.4
Marital condition not reported.....	156,524	0.3	68,172	0.2

Of the total number of males of all ages in 1910, 58 per cent were single, 38.2 per cent married, and 3.4 per cent widowed or divorced, the corresponding percentages for females being 52.7, 39.6, and 7.5.

The number of persons under 15 years of age who are married, widowed, or divorced is naturally insignificant, comprising in 1910 only 994 males and 3,713 females. Statistics of marital condition, therefore, usually relate only to persons 15 years of age and over, who, for brevity, are sometimes called adults. Table 2 summarizes the data for persons of this age.

MARITAL CONDITION.	POPULATION 15 YEARS OF AGE AND OVER: 1910			
	Male.		Female.	
	Number.	Percent distribution.	Number.	Percent distribution.

Marital condition not reported.....	156,524	0.5	68,172	0.2

¹ Includes persons of unknown age.

There were, in 1910, 32,425,805 males 15 years of age and over, and 30,047,325 females, an excess of 2,378,480 males—the number of males to 100 females being 107.9. This excess of males in the adult population of the United States has a most important bearing upon the statistics of marital condition. It accounts in part for the fact that there were 12,550,129 single men, as compared with 8,933,170 single women, or 3,616,959 more of the former than of the latter. But a further explanation of this disproportion is found in the fact that women marry at an earlier age; in other words, men remain single longer than women, and therefore there are more single men at any given time.

Other conditions being equal, the proportion of the total population who marry will be greater in a community where the sexes are numerically equal than in one where either sex outnumbers the other. In the latter case it is obvious that a larger number of persons of the sex which is in excess will remain single. Considering one sex alone, however, it is evident that the probability of marriage will increase as that sex falls below and will decrease as it rises above a numerical equality with the other sex.

Probably remarriage is more common among men than among women, hence the great excess of widows over widowers. But without doubt the excess is largely due to the fact that men usually marry at a later age than women, so that the marriage relation is more often broken by death of the husband than by death of the wife. In other words, the excess of single men over single women has as a natural correlative an excess of widows over widowers.

It will be noted that in the population 15 years of age and over there were, in 1910, 407,913 more married men than married women (18,092,600 as compared with 17,684,687), a condition largely explainable by the presence in the United States of foreign-born married men who had left wives in their native countries. The total number of men 15 years of age and over in 1910 who were or had been married (that is, the married, widowed, and divorced, taken together) was 19,720,152, or considerably less than the number of the corresponding class of women, 21,045,983. Were it not for the presence of many married men whose wives were not in this country, the disparity would, of course, be greater.

Marked differences appear between the percentages for males and those for females, as shown by Table 2. Of the males, in 1910, 60.8 per cent were either married, widowed, or divorced, while for the females the proportion was much higher, 70 per cent. Although there were, in absolute numbers, more married men than married women, the percentage married for males (55.8), being based on a larger total, was materially lower than that for females (58.9). The percentages widowed for males and for females were 4.5 and 10.6, respectively. The proportions reported as divorced were 0.5 per cent for males and 0.6 per cent for females.

Age groups.—No satisfactory analysis of statistics of marital condition can be made without considering age composition. Where a population is normally distributed by sex, the proportion which the number of persons who are or have been married forms of the total number of adults depends on three factors: (1) The age at which marriage takes place; (2) the age distribution of the population; and (3) the number who permanently remain single. Ordinarily the first and second factors have greater weight than the third in causing the differences which appear in the statistics for different classes or communities. In all cases the proportion of married, widowed, or divorced persons combined is lower among young than among older persons; consequently differences between classes or communities as to the proportion married, widowed, or divorced in the total number of adults may result merely from differences in age distribution and may not appear when comparisons are confined to limited age groups.

MARITAL CONDITION OF THE POPULATION, BY AGE PERIODS: 1910.

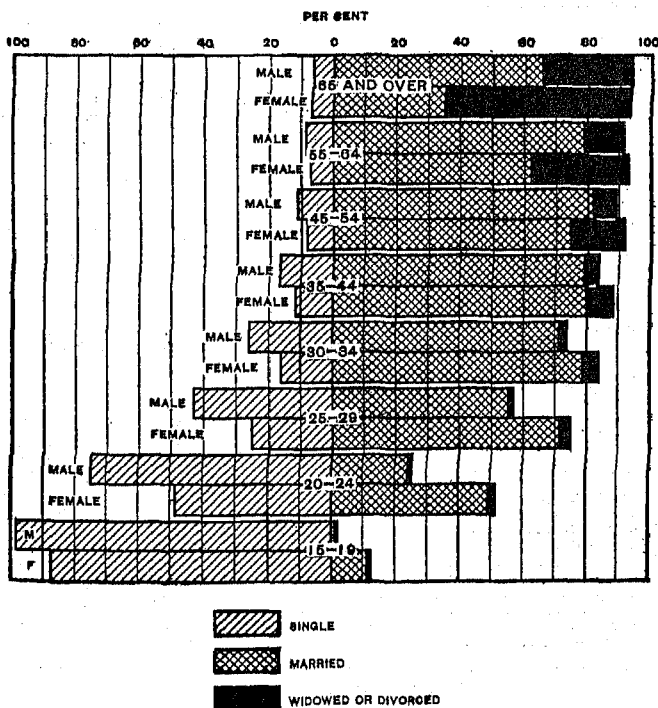

Table 3 shows, for 1910, the marital condition of the total population 15 years of age and over, classified by sex and age. The percentages are shown in the preceding diagram.

AGE PERIOD AND SEX.	POPULATION: 1910

¹ Includes persons whose marital condition was not reported.
² Includes persons of unknown age.
 * Less than one-tenth of 1 per cent.

This table shows a marked increase in the percentage for married, widowed, or divorced persons combined, with each older age group. For males, for example, only 1.2 per cent in the age group 15 to 19 years were married, widowed, or divorced, as compared with 24.6 per cent in the age group 20 to 24 years, 64.7 per cent in the age group 25 to 34 years, and in succeeding age groups 83.1, 89.7, and 93.5 per cent, respectively.

Table 3 brings out clearly the prevailing difference between men and women as to the age of marriage. In the age group 15 to 19 years the proportion married, widowed, or divorced in 1910 was 1.2 per cent for males and 11.6 per cent for females. In the age group 20 to 24 years the percentages were 24.6 for males and 51.4 for females. In the succeeding age groups the proportions for the sexes rapidly approach equality, and for persons of 65 years and over the percentage of males married, widowed, or divorced (93.5) was slightly higher than the percentage of females (93.4).

The proportion married was higher for females than for males in the age groups covering the years 15 to 44, the disparity gradually diminishing until in the group 35 to 44 years the proportion married was almost the same for both sexes. In the group 45 to 64 years the proportion married was higher among males than among females, and in the group 65 years and over the proportion married was nearly twice as high among males as among females—65.6 per cent, as compared with 35 per cent.

At all ages the proportion widowed was higher among females than among males. From 45 to 64 years of age the proportion single among males exceeds the proportion widowed, while among females the proportion widowed is over twice as high as the proportion single. In 1910 in the group 65 years and over a little over one-fourth (27.1 per cent) of the males were widowed, while nearly three-fifths (58.1 per cent) of the females were widowed. In this age group the proportion married among males was nearly two and one-half times as great as the proportion widowed, while among females the proportion widowed was over one-half higher than the proportion married. These differences may be partly attributable to more frequent remarriage of men than of women, but are chiefly due to age differences between husbands and wives.

The differences between the absolute numbers of males and of females, respectively, in the marital condition classes distinguished, in the various age groups, as shown by Table 3, are conspicuous. In each of the age groups, except that comprising persons 65 years of age and over, the number of single men in 1910 greatly exceeded the number of single women. For age periods covering the years 15 to 34 the number of females married, widowed, or divorced exceeded the number of males, the number of males exceeding the number of females for each succeeding age period. In each age group the number of widowed females greatly exceeded the number of widowed males.

The proportion of males and of females in the several age groups of the two general marital classes is brought out more clearly in Table 4, which shows, by age groups, the number of males to 100 females in the total population 15 years of age and over, in the population returned as single, and in the aggregate married, widowed, or divorced.

AGE PERIOD.	NUMBER OF MALES TO 100 FEMALES: 1910		
	Total.	Single.	Married, widowed, or divorced.
15 years and over ¹	107.9	140.5	93.7
15 to 19 years.....	99.8	111.6	10.1
20 to 24 years.....	102.3	158.0	48.9
25 to 34 years.....	109.0	182.5	89.2
35 to 44 years.....	111.8	163.3	105.0
45 to 64 years.....	114.4	144.7	111.7
65 years and over.....	101.1	99.3	101.2

¹ Includes persons of unknown age.

Although in the population 15 years and over in 1910 there were 107.9 males to 100 females, there were 140.5 single males above this age to every 100 single females, and only 93.7 married, widowed, or divorced males to 100 such females. The proportion of males among the single increased with advancing age until in the period from 25 to 34 years there were 182.5 males to every 100 females. Above this age the proportion of males among the single gradually diminished.

From 15 to 19 years there were only about one-tenth as many males as females among the married, widowed, or divorced; from 20 to 24 years, less than half as many males. In the age group 35 to 44 years, however, and in each succeeding age group, the married, widowed, or divorced males exceeded the females.

Table 5 shows by sex the marital condition of the population above specified age limits. As the calculation is restricted to population of more advanced age, the percentage single for each sex decreases, and the percentage married, widowed, or divorced increases.

¹ Includes persons whose marital condition was not reported.

It will be noted that the excess of males in the total population 15 years of age and over is due largely to the marked excess of males among the foreign-born whites and the distribution of the foreign-born whites with respect to marital condition differs materially from that of the other classes.

Table 7 gives no direct information with regard to intermarriage among the three classes of whites. Naturally, however, these classes intermarry more or less, and consequently, as already noted, there is not necessarily, and was not in fact in 1910, an equality between the number of married males and the number of married females within any one class.

Among the native whites of native parentage the number of married males in 1910 differed but little from the number of married females, and this was also true of the negroes. Among the native whites of foreign or mixed parentage, however, the married women considerably outnumbered the married men. Probably many women of this class have married foreign-born men, since the number of the latter reported as married greatly exceeded the number of married

foreign-born women. The excess of married men in the foreign-born class is partly due, however, to the presence of men who have left their wives in the home countries.

The number of single men materially exceeded the number of single women in each of the four classes shown in the table, the excess being particularly marked among the foreign-born whites, in which group single men outnumbered single women more than two to one. In each class, except among the foreign-born whites, the number of married females exceeded the number of married males, and the number of divorced females exceeded the number of divorced males, and in each class there were more than twice as many widows as widowers.

The excess of single men over single women among the native whites of native parentage is partly attributable to the fact that there are more males of this class 15 years of age and over than there are females. According to the returns, the excess in 1910 was over 700,000, the ratio of males to females being more than 104 to 100. It has sometimes been questioned whether such a marked excess of males over females actually existed among the adult population of this class. The subject is fully discussed in the chapter on age statistics. It is possible that the number of males is slightly exaggerated through erroneous classification of native whites of foreign or mixed parentage, or even of foreign-born whites, as natives of native parentage. Such errors would more frequently occur in the case of males than in the case of females. There seems little reason to doubt, however, that there is in fact a very material excess of males among native whites of native parentage. The main explanation of the excess of single men over single women in this class of the population—as well as in the class of native whites of foreign or mixed parentage, and among the negroes—is, nevertheless, to be found in the relatively more advanced age of marriage for men. Among the native whites of foreign or mixed parentage 15 years of age and over, and among the negroes, there was, according to the returns of 1910, an appreciable excess of females.

Of the total number of native white males of native parentage 15 years of age and over in 1910, 38.1 per cent were single and 61.4 per cent married, widowed, or divorced, the corresponding percentages for females being 29.9 and 69.8.

Among native whites of foreign or mixed parentage the proportion married, widowed, or divorced was much lower for both sexes (49.5 and 58.1 per cent, respectively) than among native whites of native parentage. As shown later, this difference is only in part due to differences between the two parentage classes with regard to age distribution, although the average age of the first-named class is materially lower than that of the second.

Among the foreign-born whites, on the other hand, the proportion married, widowed, or divorced, both for males and for females, 67.8 and 81.6 per cent, respectively, was higher than among the native whites of native parentage (see Table 8); in the case of males this difference is due wholly to the fact that the foreign-born whites are much older on the average, and among females also it is largely due to this cause.

The proportions married, widowed, or divorced for negro men and for negro women (64 and 73.1 per cent, respectively), were somewhat higher than for native whites of native parentage.

The difference between the sexes with respect to the proportion married, widowed, or divorced is, as shown by the percentages quoted above, more conspicuous in the case of the foreign-born whites than in the case of any other group. One cause of this marked disparity is the fact that single women are much less apt to leave their native countries for new homes than are single men. Later tables show extraordinary differences between the sexes with respect to the proportion married, widowed, or divorced in the early age groups.

The negroes are the only group shown in the table in which the proportion married is as high among males as it is among females, the percentages in the case of this race being the same for the two sexes.

The proportion of divorced persons, as shown by Table 7, is slightly higher for females than for males in each of the four classes of the population specified. As already stated, all the percentages relating to divorced persons may be assumed to be somewhat too low. The proportion of divorced persons reported is higher among negroes than in any other class, that for negro women, which is the highest of all, being 1.1 per cent.

The preceding table does not present statistics for the minor classes of the population. Data for them are presented in detail in Tables 14 and 15 (pp. 517 to 519). It may be stated that the distribution of the Indian population 15 years of age and over according to marital condition is not, in the case of the males, very different from that of the negro population. In the case of the females the proportion single in 1910—21.2 per cent—was materially lower than in the case of the negro women, while the proportion married was correspondingly higher. For the Chinese and Japanese the distribution according to marital condition is very different from that of either the native whites or the negroes. In 1910 more than half of the Chinese men and more than seven-tenths of the Japanese men 15 years of age and over were reported as single. On the other hand, of the relatively small number of Chinese and Japanese women 15 years of age and over, only 23 and 13.7 per cent, respectively, were reported as single. These conditions are due to the fact that most of the Chinese and Japanese are immigrants and that of these immigrants a very large proportion are single men. It is possible that in some cases men of these races who were in fact married but had left their

families in their home countries were erroneously reported as single.

A comparison of the statistics of the native whites of foreign parentage with those of the native whites of mixed parentage, as shown in Tables 14 and 15, shows a considerable difference between the two classes. Both among the males and among the females, the proportion of persons 15 years of age and over who were married, widowed, or divorced was in 1910 materially lower in the case of the native whites of mixed parentage than in the case of the native whites of foreign parentage, this difference being largely due to the fact that the persons of the latter class were of lower average age than those of the former. In fact, by age groups the percentage married, widowed, or divorced was generally higher in the case of the native whites of mixed parentage than in the case of the native whites of foreign parentage.

Table 8 summarizes the percentages regarding the marital condition in 1910 of the principal classes of the population according to age groups; the absolute numbers appear in Table 14. For convenience, the small percentages of divorced persons have been combined with those for the widowed. The diagram on page 513 shows graphically the percentage single, married, and widowed or divorced in each class, by broad age groups.

² Includes persons of unknown age.

³ Less than one-tenth of 1 per cent.

MARITAL CONDITION OF PRINCIPAL CLASSES OF THE POPULATION, BY AGE PERIODS: 1910.

In every age group and for both sexes the proportion married, widowed, or divorced was materially higher in the case of the native whites of native parentage than in the case of the native whites of foreign or mixed parentage. For example, in the age group 25 to 34 years, 68.5 per cent of the native white males of native parentage were married, widowed, or divorced, as compared with 55.9 per cent of the native white males of foreign or mixed parentage; the corresponding percentages for females were 80.4 and 69.2, respectively. It may be noted that in 1910 a much larger proportion of the native whites of foreign or mixed parentage than of the native whites of native parentage were living in urban communities, and that generally, other conditions being the same, the proportion married is smaller in the urban than it is in the rural population. Both in the urban and in the rural population separately considered, however, the proportion married among native white males and females

of native parentage exceeded the corresponding percentage for native whites of foreign or mixed parentage in every age period except among females 45 to 64 and 65 and over (see Tables 34 and 35, pp. 585 and 586).

Table 8 shows, also, that in each of the individual age groups the percentage married, widowed, or divorced was higher for native white males of native parentage than for the foreign-born white males. On the other hand, among females the percentages were somewhat lower for the native whites of native parentage than for the foreign-born whites of corresponding ages.

Comparing the marital condition of the native whites of native parentage with that of the negro population, it appears that in the age group 15 to 24 years the proportion married, widowed, or divorced among negro males is much greater than that among the white males of the parentage class specified. Above the 35th year there is very little difference in the proportions for the men of the two races. Among the females also the difference between the two races as to the proportion married, widowed, or divorced is much greater in the younger than in the older ages. It is evident, therefore, that as compared with whites of native parentage negroes generally marry at an earlier age. At every age the proportion remaining single was somewhat greater for whites.

The proportion widowed in all age groups is much higher for negroes than for whites, except that for males in the ages 65 years and over the proportion widowed is not greatly higher.

The proportion widowed or divorced among negro women was 18.4 per cent for those 35 to 44 years of age, 33.8 per cent for those aged 45 to 64 years, and 66 per cent for those 65 years and over—the corresponding percentages for native white women of native parentage being 7.3, 20, and 56.6.

Statistics according to single years of age.—The extent to which persons enter the marriage state before reaching a given age is not, in the case of younger persons, satisfactorily indicated by statistics for age periods. It is obvious, for example, that the proportion married among persons 15 to 19 years of age is largely affected by the fact that almost none as young as 15 or 16 are married. Consequently interest attaches to Table 16, page 520, showing, for the principal classes of the population, statistics of marital condition for single years of age from 15 to 34, inclusive.

As might be expected, Table 16 shows in general a decline in the proportion single with advancing age. The occasional exceptions appearing in the table are probably due to errors in the classification of persons according to age. The tendency to report ages in round numbers, which results in considerable concentration at the age of 30, probably affects single persons more commonly than married persons, because a

larger number of the returns for single persons are made, not by themselves or by members of their immediate family, but by others, such as boarding or lodging house keepers, who may lack accurate information as to age.

In 1910, of the native white males of native parentage who had reached the age of 19, 4.7 per cent had married; that is to say, 4.7 per cent of those 19 years of age were reported as either married, widowed, or divorced. Of the females of this class, 19 years of age, however, 28.9 per cent had entered the marriage state. Again, 44 per cent of the males and 65.9 per cent of the females 24 years of age had married.

On the other hand, of the native whites of foreign or mixed parentage only 1.2 per cent of the males and 14.2 per cent of the females 19 years of age were married, widowed, or divorced, and only 29.6 per cent and 51.3 per cent, respectively, of those 24 years of age.

Of the negroes, 7.8 per cent in the case of the males and 39.8 per cent in the case of the females 19 years of age had married, and 57.7 per cent and 75.3 per cent, respectively, of those 24 years of age.

Comparison with previous censuses.—Table 9 shows, by sex, the percentages single, married, widowed, or divorced in the total population 15 years of age and over for the last three censuses.

MARITAL CONDITION.	PER CENT DISTRIBUTION OF—					
	Males 15 years of age and over.			Females 15 years of age and over.

Divorced.....	0.5	0.3	0.2	0.6	0.5	0.4
Marital condition not reported.....	0.5	0.4	0.3	0.2	0.2	0.1

There has been for both sexes a gradual advance since 1890 in the percentage of married persons and in the percentage of married, widowed, or divorced persons combined. The latter percentage rose, in the case of males, from 58.1 in 1890 to 59.4 in 1900 and 60.8 in 1910, while the corresponding percentages for females were 68.1, 68.6, and 70, respectively. These increasing percentages are only in part, if at all, attributable to changes in the color or race, nativity, and parentage composition of the population, or to changes in age distribution.

Table 10 shows, for the same three census years by sex and principal color or race, nativity, and parentage classes, the percentages reported as single, as married, widowed, or divorced, and as married, respectively.

The percentage of married, widowed, or divorced persons combined was higher in 1910 than in 1900 or in 1890 for each sex in each of the four principal color or race, nativity, and parentage groups, except that in the case of the foreign-born white males the percentage was lower in 1910 than in 1900. In the case of native

white females of native parentage the percentage married, widowed, or divorced was slightly lower in 1900 than in 1890. These higher percentages of married, widowed, or divorced persons combined were chiefly due to a higher proportion of married persons, although the proportion of widowed or divorced persons also had generally increased.

Table 10

CLASS OF POPULATION AND SEX.	PER CENT OF PERSONS 15 YEARS OF AGE OR OVER.								
	Single.			Married, widowed, or divorced.			Married.

Male.....	31.8	29.4	32.1	67.8	70.3	67.6	62.1	63.8	62.2
Female.....	18.3	19.5	20.7	81.6	80.3	79.2	66.5	64.2	63.9
Negro:									
Male.....	35.4	39.2	39.8	64.0	60.2	60.0	57.2	54.0	55.5
Female.....	26.6	29.9	30.0	73.1	69.9	69.8	57.2	53.7	54.6

The change in the proportion married, widowed, or divorced has been particularly conspicuous among the native whites of foreign or mixed parentage. Over three-fifths (61.9 per cent) of the males of this class were single in 1890, whereas only one-half (50.2 per cent) were single in 1910. Among the females over half (51 per cent) were single in 1890 and only about two-fifths (41.7 per cent) were single in 1910. In the case of this class of the population, the increase in the proportion married is without doubt due in large measure to changes in age distribution.

Table 11 shows the percentages of males and females of specified ages reported as single, as married, widowed, or divorced, and as married, respectively, at the censuses of 1910, 1900, and 1890.

¹ Includes persons of unknown age.

In the age groups 15 to 19 years, 20 to 24 years, and 25 to 34 years, the percentage married, widowed, or divorced was greater in 1910 than in 1900, and in the case of the first two groups it was also greater in 1900 than in 1890. In the age group 25 to 34 years the percentage for males was greater in 1910 than at either of the two preceding censuses, but was less in 1900 than in 1890, while for females the percentage though greater in 1910 than in 1900, was in both those years lower than in 1890. In each of the three age groups comprising persons 35 years of age or over, a decrease occurred during both of the decades covered by the table in the percentage married, widowed, or divorced, both for males and for females, with the single exception that the percentage for males from 35 to 44 years of age increased slightly between 1900 and 1910.

Table 12 shows, for 1910, 1900, and 1890, the percentages of married, widowed, or divorced persons among males and females, respectively, for the principal color or race, nativity, and parentage groups, classified by age.

¹ Includes persons of unknown age.

For each class shown in the table the percentage of married, widowed, or divorced persons in the age groups 15 to 19 years and 20 to 24 years was higher, both for males and for females, in 1910 than in 1900

or 1890, except that the percentage for native white males of foreign or mixed parentage 15 to 19 years of age was the same in 1910 as in 1900. This would indicate that in all classes of the population a larger proportion are marrying in the earlier ages than was the case 10 or 20 years ago. At least in the case of the native whites, this change has been more conspicuous among males than among females. It appears from the table that of the native white males of native parentage from 20 to 24 years old in 1890, 20.5 per cent were married, widowed, or divorced, as compared with 23.8 per cent in 1900 and 27 per cent in 1910. For the females of this class the percentages were 51.5 for 1890, 51.2 for 1900, and 53.2 for 1910. Any falling off in the natural rate of increase of population in this country, therefore, could not be attributed to postponement of marriage.

In the age group 25 to 34 years the proportion married, widowed, or divorced was greater in 1910 than in 1900 for both males and females in all classes of the population, with the single exception of the foreign-born white males. For the two groups comprising persons 45 years of age and over, the proportion of persons in the three classes of the white population who were or had been married has shown a decrease at each census since 1890, with the single exception of the native white females of native parentage from 45 to 64 years of age, for whom the percentage was the same in 1910 as in 1900. For the white population it thus appears that, although the proportion marrying at early ages shows an increase, the proportion married, widowed, or divorced in the higher age groups was not so great in 1910 as in 1900 or 1890. Among the negroes the proportion married, widowed, or divorced in each age group was higher in 1910 than in 1900.

Comparison with foreign countries.—For purposes of comparison Table 13 is introduced, which shows the distribution, by marital condition, of the population 15 years of age and over in certain foreign countries.

It is evident from a consideration of this table that the proportion married in the United States is higher than in most foreign countries. Hungary, Bulgaria, Servia, and Russia are the only European countries included in this table in which the proportion married exceeded that in the United States. In India 68.9 per cent of the adult population were married and 18.6 per cent widowed, while only 12.6 per cent were reported as single. This is the only country included in this table in which less than 20 per cent of the total adult population were single. In Ireland over half (52.7 per cent) of the population were single and only 37.7 per cent were married. Some of the more recently settled countries, like Queensland, Victoria, and Western Australia, reported a large proportion single and a smaller proportion married.

DISTRIBUTION BY MARITAL CONDITION OF THE POPULATION 15 YEARS OF AGE AND OVER IN CERTAIN FOREIGN COUNTRIES.

¹ Divorced included with widowed.

² Less than one-tenth of 1 per cent.

³ All races.

⁴ No data obtainable.

⁵ Number enumerated 933,756, but age and civil condition not recorded.

⁶ All races, natives excepted.

⁷ Figures relate to population 16 years of age and over.

⁸ Europeans only.

⁹ Legal population.

¹⁰ Widowed included with single.

Detailed tables for the United States as a whole.— Following are presented several more detailed tables regarding the marital condition of the population of the United States as a whole.

Table 14 shows for 1910 the absolute numbers single, married, widowed, and divorced for all classes combined and for each specific class of the population, by sex and age groups.

Table 15 presents percentages corresponding to the absolute numbers in the preceding table, except those for marital condition not reported.

Table 16 shows the marital condition of the total population and of each of the principal classes of the population by sex and single years of age for the ages 15 to 34, inclusive. It will be noted that in each class of the population there is a very considerable concentration of numbers at the age of 30, due to the practice of reporting ages of adults in round numbers, where the age is not exactly known.

Table 17 gives statistics of marital condition for the total population and for the principal classes by sex and age periods at each census from 1890 to 1910.

MARITAL CONDITION.

MARITAL CONDITION OF THE POPULATION OF THE UNITED STATES: 1910.

DIVISIONS AND STATES.

Causes of differences with respect to marital condition.—As shown in the tables hereafter presented, there are very considerable differences when one section of the country is compared with another as regards the marital condition, not only of the total population but also of particular classes. With respect to the total population the marital condition of males and females in any given division or state may be materially affected by the sex, age, color or race, nativity, and parentage composition of the population; while with respect to any particular class the marital condition of the total number 15 years of age and over and of males and females, respectively, may be materially affected by the sex and age composition of the class or, where intermarriage is common, of the total population within the division or state. In the last analysis, therefore, the causes of differences in marital condition, when one division or state is compared with another, are exceedingly complex.

The marital condition of the native population may be affected by interstate migration—not merely as an indirect result of the influence of migration upon sex and age distribution, but also as a direct result of differences between persons of different marital classes with respect to the disposition to migrate. There are no statistics directly bearing on this point, but one might perhaps expect that unattached persons—single persons or widowed or divorced persons without children—would be more likely to migrate than those with families. If this is the case, one would find, other things being equal, relatively fewer unmarried persons in states or divisions which lose more than they gain through interstate migration, as compared with those which gain more than they lose.

As the result of the factors just named, there may be differences between states or divisions with respect to the marital condition of the population of any given class, wholly independent of any differences with respect to the tendency toward marriage or the age at which marriages most commonly are contracted. There are, however, when one section of the country is compared with another, differences also with respect to the tendency toward marriage, and particularly with respect to the relative frequency of early marriages.

An important factor affecting the marital condition of the population of different states and divisions is the relative importance of urban population. The sex and age distribution of urban population differs from that of rural population. Moreover, as shown later, early marriages are less frequent in cities than in rural communities. Other things being equal, a state which has a large proportion of urban population is likely to have a relatively larger number of single persons in its adult population than a state which is predominantly rural.

The different kinds of causes affecting marital condition may, of course, conflict with one another. Thus, since the South has relatively a larger proportion of its adult population in the early ages of manhood and womanhood than the North, one would expect, other things being equal, to find a smaller proportion married in the South; but the tendency toward early marriage and the large proportion rural in the population of the South more than offset the effect of the age distribution.

Special causes affecting the marital condition of the foreign-born population of the several states and divisions are the period of time at which immigration has chiefly occurred, and the countries which have contributed chiefly to the foreign-born population. The period of time at which immigration has chiefly occurred also indirectly affects the marital condition of the native whites of foreign or mixed parentage, since it affects the age distribution of that class.

Marital condition of the total population, by divisions: 1910.—Table 18 shows, for the different geographic divisions of the country, the proportions single, married, widowed, or divorced among the total number of persons 15 years of age and over, classified by sex, according to the census of 1910. The absolute numbers on which these percentages are based appear in Table 30, pages 538 to 546. The percentages are summarized graphically in the following diagram.

MARITAL CONDITION OF THE TOTAL POPULATION 15 YEARS OF AGE AND OVER, BY DIVISIONS: 1910.

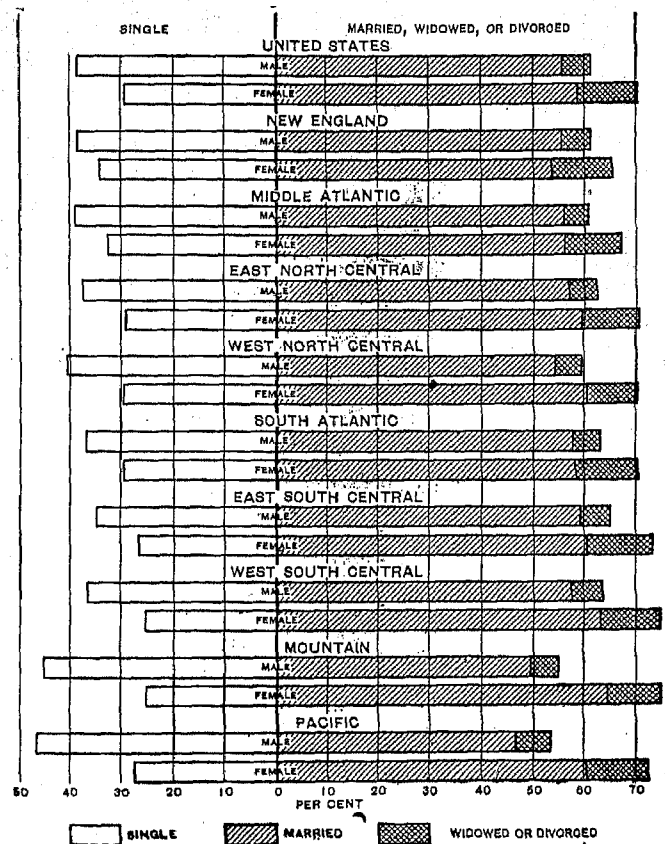

Table 18

PACIFIC:					
Male.....	46.9	51.9	46.7	4.2	1.0
Female.....	27.4	72.4	60.5	10.6	1.3

These percentages for the total population are much less significant than those subsequently presented for particular classes of the population and for age groups. The percentage of females who were or had been married was, in 1910, lower in New England than in any other geographic division. This condition is partly attributable to the fact that New England is

the only geographic division in which females outnumbered males in the population 15 years of age and over, but other factors also enter into it, as shown later. The proportion of females married, widowed, or divorced was higher in the Mountain and Pacific divisions than in any of the four northern divisions, but the proportion for males was lower in those two divisions than in any other, whether in the North or in the South. This was largely due to the fact that the excess of males over females was much greater in the Mountain and Pacific divisions than elsewhere, because of migration to them from other parts of the country. The high proportion married, widowed, or divorced in the South was partly due to the high proportion in the negro population, but partly also to the earlier age of marriage, even among the whites.

The proportion widowed was highest for both sexes in the East South Central and New England divisions. For males the proportion was lowest in the Mountain and Pacific divisions and for females in the West North Central and Mountain divisions.

The proportion divorced was highest for both sexes in the Mountain and Pacific divisions and lowest for both sexes in the Middle Atlantic division.

Color or race, nativity, and parentage classes, by divisions.—Table 19 shows, for 1910, by geographic divisions, the proportion of the male and female population 15 years of age and over in each of the principal classes of the population who were married, widowed, or divorced, and also the proportion who were married. (For absolute numbers, see Table 30.)

For the native white males of native parentage the proportion married, widowed, or divorced was higher in New England than in any other division, probably because this is the only division in which the men were less numerous in the population than the women. In none of the other northern divisions, however, was the proportion married, widowed, or divorced among males as high as it was in each of the southern divisions. The East South Central division ranked next to New England in this respect. In the Mountain and Pacific divisions, where the males greatly outnumbered the females, the proportion married, widowed, or divorced among the native white men of native parentage was very much lower than elsewhere.

For the females of this class of the population the proportion married, widowed, or divorced was somewhat higher, speaking broadly, in the West than it was in the East and higher in the South than it was in the North. There was, however, no very great difference among the four geographic divisions of the North in this respect, though the proportions in the East and West North Central divisions were somewhat higher than those in the New England and Middle Atlantic divisions. Of the southern divisions, the South Atlantic showed a slightly lower proportion married, widowed, or divorced among women of this class than the East and West North Central divisions, but the other two southern and the Mountain and Pacific divisions showed higher proportions than any of the northern divisions.

For the native whites of foreign or mixed parentage the proportions married, widowed, or divorced varied in a manner somewhat similar to that for the native whites of native parentage. It is noteworthy, however, that in the case of both sexes the proportions were much higher in the East North Central division than in any of the other northern divisions; while in New England the proportions for both sexes were much lower than in any of the other divisions. In each of the southern divisions the proportion married, widowed, or divorced in the case of both sexes was higher than in any of the northern divisions, partly because of earlier marriages, but partly because of decided differences in age distribution, the persons of this class being of higher average age in the South than in the North. In the Mountain and Pacific divisions the proportions married, widowed, or divorced among the males of this class were not very different from those in some of the northern divisions, but for females the proportions were materially higher, particularly in the Mountain division, than they were in the North, and approximately the same as those in the southern divisions.

Variations from division to division in the proportion married, widowed, or divorced among the foreign-born whites may be accounted for partly by varying age distribution and average length of residence in this country (consequent upon varying periods of largest immigration for the several divisions) and partly by

varying character of the foreign-born whites as regards nationality. In the case of the men the East South Central division, most of whose immigrants arrived at an early date, shows a higher proportion married, widowed, or divorced than any other, the East North Central division ranking next. The Mountain and Pacific divisions show very low proportions for the males. In the case of the women the West North Central division, which received the larger part of its immigration some time ago, shows the highest proportion married, widowed, or divorced, and the Mountain division the next highest proportion, while the proportion was lowest in the New England and Middle Atlantic divisions, which have been receiving very large numbers of immigrants in recent years.

For negroes, the proportions married, widowed, or divorced in the case of males were higher in the three southern divisions than elsewhere, the lower proportions in other divisions being doubtless attributable in part to the large proportion of unmarried men among negro migrants. On the other hand, the two north central and the two western divisions show a larger proportion married, widowed, or divorced among negro women than is shown by any one of the three southern divisions, this being largely the result of the fact that males outnumbered females in the negro population of these divisions. Of the southern divisions, the East South Central shows the highest proportion married, widowed, or divorced among the males and the West South Central the highest among the females, the West South Central being the only southern division in which negro males outnumbered negro females.

Comparing the different color or race, nativity, and parentage groups within the same division, it appears that for males the percentage married, widowed, or divorced was highest among the foreign-born whites in every division excepting the Pacific, where the highest proportion was among the native whites of native parentage. For females the highest percentage married, widowed, or divorced was, in all geographic divisions, among the foreign-born whites. In explanation it may be noted that a comparatively small proportion of the foreign-born white adult population is in the early age groups, in which the proportion married is low for all classes. The percentage married, widowed, or divorced was lowest in every division and for both sexes among the native whites of foreign or mixed parentage, a fact, as will be shown later, only in part attributable to the relatively large number of young persons in this class.

In all divisions, and for each color or race, nativity, and parentage group, the proportion married, widowed, or divorced was higher for females than for males, and in a majority of cases the proportion of married persons alone was higher among females.

Marital condition in relation to age.—The differences which have been shown to exist among the several geographic divisions with respect to the marital condition of

each class of the population are due partly, as already pointed out, to differences in the relative numbers of the sexes, and in the age distribution of the sex groups.

Table 20 shows for each of the principal classes of the population for the United States, by geographic divisions, the percentage married, widowed, or divorced, by sex and age groups. The absolute numbers on which these percentages are based are pre-

sented in Table 30, page 538. The percentages for the age groups from 15 to 24 years are significant as showing the prevalence of early marriages, while those for the age group 45 years and over are significant because comparatively few marriages occur after the age of 45. For comparison, the ratio of males to females in the total white population, and in the negro population, is presented.

PER CENT MARRIED, WIDOWED, OR DIVORCED IN THE POPULATION 15 YEARS OF AGE AND OVER, BY DIVISIONS: 1910.

A striking fact brought out by these figures is that the proportion of early marriages among native whites of native parentage is much larger in the South than in either the North or the West. For the three southern divisions, the proportion of women of this class 15 to 19 years of age who were married, widowed, or divorced, ranged in 1910 from 15.3 per cent to 20.1 per cent, being highest in the West South Central division. For the northern and western divisions, the proportions ranged from 6.6 per cent in New England to 14 per cent in the Mountain division. For both sexes the proportion married, widowed, or divorced of those 20 to 24 years of age was greater in each of the southern divisions than in any one of the northern divisions.

In the case of men of this age group the proportions for the southern divisions were much higher than those for the western divisions. In the case of women, however, the Mountain division shows a higher percentage married, widowed, or divorced in this age group than the South Atlantic, although not so high as the East South Central and West South Central. It is obvious that in the case of females the prevalence of early marriages, as judged by the percentage married, widowed, or divorced, in the age group from 15 to 24 years of age, is not only greater in the South than in the North, but is greater in each successive division from east to west; except that in the Pacific division the proportion among those 15 to 19 years

of age was lower than in the West North Central or Mountain divisions, while the proportion among those 20 to 24 years was lower than in the Mountain division and the same as in the West North Central. The great excess of males over females in the western divisions accounts for the comparatively small proportion married among males.

For the age 45 years and over the proportion married, widowed, or divorced among native whites of native parentage, of either sex, varied less from division to division than the corresponding proportions among younger persons. For men of this age group the proportions married, widowed, or divorced were highest in the three southern divisions and lowest in the two western divisions. In the case of females the conditions were somewhat different. The proportions married, widowed, or divorced were appreciably lower in the New England, Middle Atlantic, and South Atlantic divisions, along the eastern seaboard, than in any of the divisions farther west. The highest percentages in 1910 were found in the West South Central, Mountain, West North Central, and Pacific divisions, in the order named, the differences among these four divisions being slight. In the West South Central division the high figure for females is explained both by the high percentage married characteristic of the South generally and by the fact that males decidedly outnumber females, largely as the result of migration from other states.

In the case of the native whites of foreign or mixed parentage it will be seen that for the younger age groups, from 15 to 24 years, the differences between the South and the rest of the country were in general much less marked than in the case of the native whites of native parentage, although the proportion married, widowed, or divorced among young persons was much higher in the West South Central division than in the North. Throughout the country early marriages are much less frequent among native whites of foreign or mixed parentage of both sexes than among native whites of native parentage, and, moreover, in all age groups shown in Table 20 the proportion married, widowed, or divorced is everywhere appreciably lower for the former than for the latter class.

Table 20 shows that early marriages among negroes of both sexes are much more common in the South than in the North, and more common among the negroes than among the whites. The statistics for negroes in the divisions of the North and West are materially affected by migration.

Marital condition, by states.—Table 21 shows, by states, the percentage married, widowed, or divorced for all persons 15 years of age and over in the total population and in the principal classes of the population, by sex, for 1910. The absolute numbers, together with separate percentages for those single, those married, and those widowed, appear in Table 32, page 548.

In general the states show conditions with respect to the marital condition of each class of the population roughly similar to those prevailing in the geographic divisions in which they are respectively situated. There are, however, some rather conspicuous exceptions.

It will be seen that in the case of native whites of native parentage the states of Maine, New Hampshire, and Vermont show, for both sexes, a decidedly larger proportion married, widowed, or divorced than the three southern New England states. These differences may be in part accounted for by differences in age distribution, and in the proportions urban and rural; and by the fact that from the three northern New England states there has been a considerable net emigration of native whites of native parentage, which has undoubtedly somewhat reduced the proportion single. Wisconsin shows a very much smaller proportion

married, widowed, or divorced for both sexes in this class of the population than any of the other states in the East North Central division. This difference is not due to peculiar age distribution of the population of Wisconsin, but appears generally throughout each age group (see Table 32, p. 548). The conditions in Minnesota are very similar to those in Wisconsin, the proportion married, widowed, or divorced being much lower, in the case of both sexes, in that state than in most of the other states of the West North Central division. It may be noted that in the case of the males alone the proportion married, widowed, or divorced was also relatively low in North and in South Dakota—a fact attributable largely to the decided excess of males in the population of those states.

In Louisiana the proportion married, widowed, or divorced among native whites of native parentage, of both sexes, was materially lower than in the other states of the West South Central division, this being true in general of all the age groups. Finally, very considerable differences appear among the several states of the Mountain division with respect to the marital condition of native white men of native parentage, these differences being largely attributable to the decided variations in the ratio of males to females, the excess of males in some of the states being exceedingly great. So far as women of this class are concerned, most of the states of the Mountain division show approximately uniform conditions, but it is noteworthy that the proportion married, widowed, or divorced was decidedly lower in Utah than in any other Mountain state, partly because there is less excess of males in Utah than elsewhere in the division. Early marriages are, however, much less common among the women in Utah than in other Mountain states, although there was comparatively little difference as to marital condition in the case of the women of the older age groups.

For the native whites of foreign or mixed parentage, there are also some exceptional conditions in particular states. Differences appear between the northern and the southern New England states similar to those in the case of the native whites of native parentage. Indiana shows a decidedly larger proportion married, widowed, or divorced among both males and females than the other states of the East North Central division. Wisconsin does not show such exceptional conditions with respect to this class as with respect to the native whites of native parentage, but Minnesota and North Dakota show for this class, as for the native whites of native parentage, much smaller proportions of both sexes, married, widowed, or divorced as compared with other states of the West North Central division. West Virginia has relatively high proportions married, widowed, or divorced among persons of this class as compared with other South Atlantic states, and Delaware, the lowest proportions. Texas shows for both sexes a much smaller proportion than the other states of the West South Central division,

largely because of differences in age distribution. The proportions married, widowed, or divorced among males of this class in the various states of the Mountain division are affected by variations in the sex ratio in the same way as those for the native whites of native parentage.

Considerable variations appear among the states even within a single division with respect to the marital condition of the foreign-born white population, these being largely attributable to differences with respect to the period of time at which immigration has chiefly occurred and with respect to the countries from which immigrants have been drawn.

West Virginia presents conditions with respect to the marital condition of negro men somewhat different from those of most other Southern states, the proportion married, widowed, or divorced being much lower, doubtless largely because of the migration of unmarried men to West Virginia from states farther south, especially for work in the mines. The proportion married, widowed, or divorced among negro women in Florida and Oklahoma was higher than in the other Southern states.

Table 22 shows, by states, for 1910, the percentages single, married, widowed, divorced, and not reported, respectively, without distinction by sex, of the total population 15 years of age and over.

There are four states—Wyoming, Montana, Nevada, and Minnesota—in which over 40 per cent of the population were single. All of these states, with one exception, are in the Mountain division. There are two states—Arkansas and Oklahoma—in which less than 30 per cent were single. Both of these states are in the West South Central division.

There are nine states in which 60 per cent or more of the population were married. Of these Georgia, Alabama, Mississippi, Arkansas, Oklahoma, Kansas, and New Mexico are contiguous states stretching nearly across the continent, while Michigan and Indiana are in the East North Central division. There are only two states in which less than half of the population were married, Wyoming with 49.4 per cent and Nevada with 49.7 per cent. Montana and the District of Columbia follow with 50.6 per cent and 51.1 per cent, respectively.

In the District of Columbia 10.8 per cent of the population 15 years of age and over were widowed. Next in order follow Maine and New Hampshire in each of which 9.3 per cent of the adult population were widowed. In North Dakota and Wyoming only 3.9 per cent were widowed.

According to Table 32 there are three states in which more than half of the males 15 years of age and over were single. These are Wyoming (56.3 per cent), Montana (52.4 per cent), and Nevada (51.3 per cent). All of these are in the Mountain division. There are seven states in which less than 35 per cent of the adult males were single. They are Indiana, Georgia,

Arkansas, Mississippi, Vermont, Alabama, and Maine. Four of these are Southern states, two in New England, and one in the East North Central division.

There are two states—Georgia and Alabama—in which three-fifths or over of the adult males were married. In Wyoming less than two-fifths of the adult males were married. In all of the New England, Middle Atlantic, East North Central, South Atlantic, East South Central, and West South Central states, more than half of the adult males were reported married, while in all of the Pacific states, all but three of the Mountain states, together with Minnesota and North Dakota in the West North Central division, less than half of the adult males were married.

The proportion of males reported as widowed was highest in Maine (6.4 per cent), Vermont (6.2 per cent), and New Hampshire (6.1 per cent). These New England states are the only ones in which more than 6 per cent of the adult males were widowed. Less than 3 per cent of the adult males were widowed in Wyoming (2.8 per cent), North Dakota and Utah (2.9 per cent).

More than one-third of the females 15 years of age and over were single in Massachusetts (36.9 per cent), Rhode Island (35.8 per cent), Minnesota (35 per cent), District of Columbia (34.5 per cent), New York (33.7 per cent), and Connecticut (33.6 per cent). With the exception of Minnesota and the District of Columbia these are all northeastern states. Less than one-fourth of the adult female population were single in Texas, Nevada, Oklahoma, Arizona, New Mexico, Florida, Wyoming, Arkansas, and Idaho. With the exception of Florida all of these states are in the West South Central and Mountain divisions. Over two-thirds of the adult female population were reported married in Oklahoma, Wyoming, Idaho, and Nevada. With the exception of Oklahoma all of these states are in the Mountain division. In the District of Columbia only 48.8 per cent of the adult female population were married. There is no state in which less than half of the adult females were married. In Massachusetts 51.2 per cent of the adult females were married, followed by Rhode Island (52.2 per cent). At least one-eighth of the adult females were widowed in Georgia, Mississippi, New Hampshire, Louisiana, and the District of Columbia. The smallest proportion of widowed among adult females was reported in North Dakota with 5.2 per cent.

Comparative statistics of marital condition, by divisions: 1890–1910.—Table 23 shows, by geographic divisions, the percentage married, widowed, or divorced in the total population and in each of the principal classes of the population, classified according to age, for each of the last three censuses. The absolute numbers upon which the percentages for 1900 and 1890 are based are not published in this Report but will be found in the reports of the respective censuses.

In every division the proportion married, widowed, or divorced in the total adult population, for both sexes, was higher in 1910 than in 1890, and except for females in the Mountain division, higher than in 1900. In the three northeastern divisions—the New England, Middle Atlantic, and East North Central—and also in two of the southern divisions and in the Pacific division, the proportion for both sexes increased gradually from 1890 to 1910. In the other divisions, while the proportion for males increased from each census to the next, in the case of females the proportion married, widowed, or divorced in the West North Central and West South Central divisions was higher in 1890 than in 1900.

Particular interest attaches to the figures showing the changes with respect to early marriages, namely, the percentages for the age groups under 25 years. There has been throughout the entire country an increase in the proportion of males marrying at early ages, but for females the tendency has not been entirely uniform. In most of the divisions there has been, for both sexes, a decrease in the proportion married, widowed, or divorced in the age periods above 45 years.

MARITAL CONDITION.

¹ Totals include persons of unknown age.

More significant than the changes with respect to the total population have been those with respect to individual classes. Among the native white males of native parentage 15 years of age and over the proportion married, widowed, or divorced was higher in 1910 than in 1890 in every geographic division except the Middle Atlantic; but in the case of women there were five geographic divisions—the New England, Middle Atlantic, East North Central, West North Central, and Mountain—in which the proportion was lower in 1910 than 20 years before. The tendency toward earlier marriages among men of this class has been general throughout the country. On the other hand, in three divisions—the New England, Mountain, and Pacific—the proportion of women 15 to 19 years of age who were married, widowed, or divorced was lower in 1910 than in 1890; and in these divisions, and also in three others—the Middle Atlantic, West

North Central, and West South Central—the proportion for the age group 20 to 24 years was lower in 1910 than in 1890. In six of the geographic divisions, however, the proportion of women of this class 20 to 24 years of age who were married, widowed, or divorced was higher in 1910 than in 1900, the only exceptions being the New England, Middle Atlantic, and Mountain divisions.

In almost every division the proportion married, widowed, or divorced for native whites of native parentage of both sexes, in the age groups 45 years and over, was lower in 1910 than it was in 1890.

It is possible that the explanation of the fact that the tendency toward earlier marriages is more marked in most parts of the country in the case of men than of women is to be found in the rapid growth of urban population. As shown later, women less often marry at an early age in cities than in rural communities.

¹ Totals include persons of unknown age.

In the case of the native whites of foreign or mixed parentage there has been, since 1890, in every division an increase for both sexes in the proportion married, widowed, or divorced. This is true not only for the total number 15 years of age and over—which might be expected from the fact that the average age of persons of this group was considerably higher in 1910 than 10 or 20 years before—but in most cases it is true specifically for persons in the age periods 15 to 19 and 20 to 24 years. In other words, early marriages appear to be more common in this class of the population throughout the country than formerly. In some divisions the proportions in the age groups 15 to 24 years who were married, widowed, or divorced were almost twice as high in 1910 as in 1890. Thus, in the Pacific division, of the males of this class from 20 to 24 years old only 7 per cent in 1890 were married, widowed, or divorced, as compared with 13.5 per cent in 1910. The only striking exception to this tendency appears in the Mountain division in the case of females, the proportion married, widowed, or

divorced in the age period 20 to 24 years being lower in 1910 than in 1890. There has been among persons of this class in most of the divisions a rather widespread decline in the proportion married, widowed, or divorced in the more advanced age groups.

In every division except New England the proportion of foreign-born white males 15 years of age and over who were married, widowed, or divorced was lower in 1910 than in 1900, this decrease resulting mainly from the fact that recent immigration has consisted largely of unmarried males. In the majority of the divisions, however, the proportion was higher than in 1890. The most marked change between 1900 and 1910 was in the South Atlantic division, where the proportion was only 66.4 per cent in 1910, as compared with 73.2 per cent in 1900 and 71.5 per cent in 1890. For foreign-born females, however, the proportion was higher in 1910 than in either 1900 or 1890 in every division except the West South Central, in which the proportion for 1910 was the same as that for 1900, although higher than that for 1890.

¹ Totals include persons of unknown age.

Among negroes of both sexes the tendency toward earlier marriage is almost universal throughout the country. This is largely the explanation of the fact that in every geographic division the proportion married, widowed, or divorced was higher in 1910 than in 1900 or 1890 in the total adult negro population of each sex. The increase in the proportion mar-

ried, widowed, or divorced among the earlier age groups has been very conspicuous in some of the geographic divisions outside the South, where negroes are relatively few, and has been very considerable in the South itself, noticeably so in the South Atlantic division. The proportions in the upper age groups have changed but little.

Detailed tables, by divisions and states.—The detailed tables dealing with the marital condition of the population, by geographic divisions and states, are so extensive that they are presented after the text discussion of the statistics regarding the urban and rural population and the population of principal cities. These tables, which appear on pages 538 to 584, are as follows:

Table 30 (pp. 538 to 546) shows by geographic divisions, for 1910, statistics of marital condition in detail for the principal classes of the population, the classification by age being more detailed than that carried by the tables for the states. Figures are shown also for the Indians, Chinese, and Japanese separately, but without age classification.

Table 31 (p. 547) shows by divisions and states, for 1910, the number of persons of all ages (including children under 15) single, married, widowed, or divorced, respectively.

Table 32 (pp. 548 to 572) presents, for 1910, detailed statistics regarding marital condition by states, similar to those presented by divisions in Table 30, the age classification, however, being less detailed.

Table 33 (pp. 573 to 584) presents, by divisions and states, for 1910, 1900, and 1890, statistics regarding the marital condition of the total population 15 years of age and over and of the principal classes of the population of that age.

URBAN AND RURAL COMMUNITIES.

United States as a whole.—The tables which follow show the differences between urban and rural communities with respect to the marital condition of the population.

Table 24 shows the percentage married, widowed, or divorced in the urban and rural communities of the United States as a whole in 1910, with distinctions of sex, color or race, nativity, parentage, and age. (For the absolute numbers, see Table 34.)

It will be seen that in the case of every class of the population covered by the table, marriage, on the part of women, is less common or is longer deferred in cities than in rural communities. In every age group of each class the proportion married, widowed, or divorced among women was lower in urban than in rural communities, the difference being particularly great in the case of the younger age groups. For men a similar difference appears in the case of all the native groups—the native whites of native parentage, the native whites of foreign or mixed parentage, and the negroes—with only one minor exception, the percentage married, widowed, or divorced for native white men of foreign or mixed parentage 15 to 24 years of age being higher in urban than in rural communities. In the case of the foreign-born white males, however, the proportion married, widowed, or divorced in each age group was greater in the urban than in the rural communities. The difference between urban and rural communities with respect to the native groups in the United States

as a whole is much less conspicuous in the case of males than in the case of females, and, as shown later, in some of the geographic divisions the conditions as to males are the opposite of those for the United States as a whole. In considering the apparent abnormally low proportion married, widowed, or divorced among the foreign-born white men in rural communities it should be borne in mind that a very large number of such men were engaged not in agriculture, but in mining or lumbering, or in construction work on railroads or other enterprises. Of the foreign-born whites engaged in these occupations, a very large proportion are single.

¹ Includes persons of unknown age.

The fact that in every age group the proportion of single women was greater in urban than in rural communities is largely attributable to the greater opportunities for women to support themselves in the cities. As a result of these greater opportunities, the excess of males over females which appears in the white population of the country was, as already shown in Chapter III, much less marked in urban than in rural communities, and, in fact, in the urban communities of some sections of the country the females outnumbered the males, while in no geographic division of the country was this true of rural communities. Migration from country to city is more common among young unmarried men and women than among married persons or older persons, and the number of unmarried women who move to the cities is probably greater than the number of unmarried men.

This table shows further that the differences among the several classes of the population with respect to marital condition are by no means wholly attributable to differences among those classes with respect to the proportion resident in urban and rural communities, respectively. Differences similar to those which appear in the total population appear both in the

urban and in the rural communities. Thus in both classes of communities the proportion married, widowed, or divorced among native whites of foreign or mixed parentage in all age groups is materially lower than the corresponding proportion for the native whites of native parentage; while in both classes of communities the foreign-born white women show a much larger proportion married, widowed, or divorced than either of the native white classes. In both classes of communities, moreover, the negroes of both sexes show, with one slight exception, a larger proportion married, widowed, or divorced in all age groups than the native white classes.

Geographic divisions.—Table 25 shows, for each geographic division in 1910, the percentage married, widowed, or divorced among native whites of native parentage in urban and rural communities, respectively. The absolute numbers in each marital condition class, together with separate percentages for those single, married, or widowed, respectively, are shown in Table 35, page 586, which also presents the data regarding other classes of the population on which Tables 26, 27, and 28 are based.

¹ Includes persons of unknown age.

The above table shows that in this, the most important class of the population numerically, there was in no geographic division any exception to the rule that among women marriage is less common or is longer deferred in urban than in rural communities. Particularly in the case of the younger age groups the proportion of women married, widowed, or divorced was very much lower in urban than in rural communities. In the

case of men, the northern and western divisions present exceptions to this condition, these exceptions, however, being found only in the age group 15 to 24 years and in the age group 45 years and over, none appearing in the group 25 to 44 years.

Table 26 presents percentages for the native whites of foreign or mixed parentage similar to those given in Table 25. The conditions with respect to this class are very similar to those with respect to the native whites of native parentage. For women there was but one exception to the rule that the proportion married, widowed, or divorced is lower in urban than in rural communities, and the exceptions in the case of the men are for the most part in the same divisions that show exceptions with respect to the native white men of native parentage.

¹ Includes persons of unknown age.

Table 27 presents percentages regarding the marital condition of the foreign-born whites by geographic divisions. The conditions with respect to the marital condition of foreign-born white women in the two classes of communities were similar to those for the native white classes. In the case of the men, however, it will be seen that in every geographic division, except the West South Central, the proportion married, widowed, or divorced in one or more of the age groups was higher in urban than in rural communities; and in six of the divisions this was true of every age group, although in the East North Central division, where it holds true of every separate age group, it does not hold true of the total number 15 years of age and over,

because of their unusual age distribution. A possible reason for this condition with respect to the foreign-born white men in rural communities has already been suggested (see p. 534). Table 27 shows altogether extraordinary differences between males and females among the foreign-born whites with respect to the proportion married, widowed, or divorced in the earlier ages, particularly in the rural communities. For example, in the rural communities of the Pacific division only 7.6 per cent of the foreign-born white men 15 to 24 years of age were reported as married, widowed, or divorced, while the corresponding percentage for women was 54.3. In the Mountain division the corresponding percentages were 9.8 and 59.3; in the South Atlantic, 11.3 and 60.3.

¹Includes persons of unknown age.

Table 28 relates to the marital condition of the negroes in urban and rural communities. It will be seen that in the three southern divisions, where the great bulk of the negro population is found, the proportion married, widowed, or divorced among negro women was uniformly lower in urban than in rural communities; and the same was true of negro men, except that in the West South Central division the proportion for those from 15 to 24 years of age was slightly higher in the urban communities. Outside of the South, where the negro population has been greatly affected by migration, the conditions are quite different. In several of the northern and western divisions the proportion, even of the women in some age groups, who were married, widowed, or divorced was higher in urban than in rural communities; and this was the case quite uniformly with respect to the men, though a few exceptions appear in certain age groups.

Classes of cities.—Table 29 shows, for the United States as a whole, the percentage married, widowed, or divorced among persons 15 years of age and over, in rural communities and in cities classified into three groups according to size. The absolute numbers on which this table is based, together with more detailed percentages, and also corresponding figures for each geographic division, are presented in Table 36, page 596.

Table 29

CLASS OF POPULATION.	PER CENT OF PERSONS 15 YEARS OF AGE AND OVER MARRIED, WIDOWED, OR DIVORCED: 1910							
	Rural communities.		Cities of 25,000 to 100,000.		Cities of 100,000 and over.		All classes.	
	Male.	Female.	Male.	Female.	Male.	Female.	Male.	Female.
All classes.....	62.1	73.2	61.5	69.0	60.0	67.4	87.9	65.5
Native white—Native par....	62.8	72.6	62.2	68.3	59.9	66.7	84.6	62.0
Native white—For. or mixed percentage.....	51.5	64.0	51.6	58.0	49.1	55.4	46.5	53.9
Foreign-born white.....	67.4	89.8	67.8	82.8	67.9	78.9	68.0	77.6
Negro.....	64.8	73.7	62.9	71.8	62.8	73.0	61.5	71.6

Not only was there, in the case of the native white classes and the negroes, a smaller proportion of married, widowed, or divorced persons in urban than in rural communities, but the proportion almost uniformly decreased with increasing size of cities. In the case of females of each of the two native white classes, there was a steady decline in the proportion married, widowed, or divorced with increasing size of cities; and the same was true of the negroes, except that the cities of 25,000 to 100,000 inhabitants showed a higher percentage than either of the other urban groups—a condition found not only in the country as a whole but in

most of the geographic divisions. In the case of males the native whites of native parentage show a uniform decline in the proportion with increasing size of cities, but, although this is true of the United States as a whole, there are exceptions to the rule in some of the geographic divisions corresponding more or less closely to the exceptions already pointed out with respect to urban and rural communities. In the case of native white males of foreign or mixed parentage, however, the cities of 2,500 to 25,000 inhabitants show a higher proportion married, widowed, or divorced than the rural communities in the United States as a whole, and in a number of the geographic divisions there were exceptions to the rule that the proportion declines with increasing size of cities. Among the foreign-born white males the proportion married, widowed, or divorced increased with increasing size of cities, this being true of the United States as a whole and for two of the geographic divisions; but for females the opposite was almost uniformly the case.

Detailed tables for urban and rural communities.—The detailed tables dealing with the marital condition of the population 15 years of age and over in urban and rural communities and in cities classified according to size appear on pages 585 to 614. These tables relate to 1910 only.

Table 34 (p. 585) presents statistics regarding the marital condition of the population of urban and rural communities in the United States as a whole. It differs from Table 35 in the fact that the age classification is more detailed.

Table 35 (pp. 586 to 595) shows, for the United States and each geographic division, statistics regarding the total population and each important class of the population, according to three age groups, for urban and rural communities.

Table 36 (pp. 596 to 600) shows, for the United States and for geographic divisions, statistics regarding the marital condition of the total population and of each of the principal classes of the population, for urban and rural communities and for cities classified according to size.

Table 37 (pp. 601 to 614) gives statistics for the urban and rural population of each state, the total population in each case being classified into three age groups, while for the individual classes of the population the figures relate to the aggregate population 15 years of age and over.

PRINCIPAL CITIES.

Tables dealing with the marital condition of the population of individual cities are presented on pages 615 to 687.

Table 38 (pp. 615 to 642) presents detailed statistics regarding marital condition for each city of 100,000 inhabitants or more, the data being given for the total population and for each of the principal classes of the population according to age groups, and for the minor classes of the population without distinction of age.

Table 39 (pp. 643 to 646) gives statistics regarding marital condition for each of the principal classes of the population 15 years of age and over in 1910, 1900, and 1890 in cities of 250,000 inhabitants or more.

Table 40 (pp. 647 to 652) gives statistics regarding marital condition for each of the principal classes of the population 15 years of age and over in 1910 and 1900, by sex, in cities of 100,000 to 250,000 inhabitants.

Table 41 (pp. 653 to 687) gives statistics regarding marital condition of the population 15 years of age and over in 1910, by sex, classified according to three age groups and according to the principal classes, in cities of 25,000 inhabitants or more.
