

Geo. Kile met with a painful accident Saturday afternoon by having his right arm broken while attending separator. The manner in which it happened was something like this: he reached in to aid in clearing the conveyor and was thus engaged when a belt slipped off from a pulley and caught his arm and wound it around the shaft, breaking both bones of the forearm. As luck would have it the engineer had closed the throttle for some reason, not knowing that Mr. Kile was caught in the machinery, and the machine was beginning to run with a slack motion just at the time of the accident. Had the machinery been running at full speed, the chances are that Mr. Kile's arm would have been torn from the body. The accident is bad enough as it is, and we all sympathize with the unfortunate man but when we think of how serious it might have been we believe Mr. Kile can consider himself quite fortunate.
